

Snipings

The rubric ‘Snipings’, introduced into the World Trade Review in 2004, is intended for contributions which, while rigorous, are shorter and therefore less extensively developed and documented than our standard length articles. It offers, among other things, an opportunity for early analyses targeting topical policy issues concerning the multilateral trading system.

China’s export restriction policies: complying with ‘WTO plus’ or undermining multilateralism

BARIS KARAPINAR *

World Trade Institute, University of Bern

Abstract: Export restrictions imposed on various food products and natural resources have been subject to extensive public attention. Most recently, China’s restrictions of its exports of certain minerals and rare earth metals have led to heated debates. The United States (US), European Union (EU), and Mexico have already filed a WTO dispute case against China on this matter. This paper describes the policy objectives and the global welfare implications of export restrictions. It summarizes the relevant WTO regulation, and offers a detailed analysis of the *China–Raw Materials* case which is before the Dispute Settlement Body (DSB). It argues that although export restrictions is arguably an area of ‘under-regulation’ or ‘regulatory deficiency’ in the WTO law, it is strongly biased against the late accession Members, including China. Yet, the way that China institutes its export restrictions raises serious questions about its role in the multilateral trading system, which it relies on for its economic prosperity. Hence, this is an area where China is likely to feel the implications of its so-called ‘WTO-plus’ commitments on its domestic and trade policies.

1. Introduction

China has recently been under the spotlight regarding its export restriction policies. In December 2009, the Dispute Settlement Body (DSB) of the World Trade

Research for this paper was funded by the Swiss National Science Foundation under a grant to the National Centre of Competence in Research on Trade Regulation, based at the World Trade Institute of the University of Bern, Switzerland. Without implicating them, I would like to thank Pierre Sauvé, San Bilal, Sheila Page and two anonymous referees for their valuable comments on earlier versions of this paper, and I am grateful to editor L. Alan Winters for his constructive suggestions.

Organization (WTO) established a panel to examine complaints by the United States (US), the European Union (EU), and Mexico concerning China's export restrictions on selected minerals (*China–Raw Materials* case).¹ The commodities in question were bauxite, coke, fluorspar, magnesium, manganese, phosphate (yellow phosphorus), silicon (metal and carbide), and zinc. More recently, in November 2010, China was alleged to be restricting its exports, this time, of rare earth metals, in which it is almost a monopoly supplier, to Japan and to other industrialized countries which attracted substantial international media attention.² China's export restriction policies raise serious questions about its role in the multilateral trading system in general and the implications of its so-called 'WTO-plus' commitments for its domestic and trade policies in particular.³

What are the policy objectives of China in instituting export restrictions? Is the policy simply a reaction to certain non-trade political disputes with Japan and the US creating trade-related tensions? Alternatively, is it a reflection of China's assertiveness in the growing global competition over natural resources? Similarly, could its concerns over domestic environmental protection and sustainable use of exhaustible resources play an important role as a policy objective? Given that China is major producer, consumer and trader of many commodities that are strategically important for global supply chains, its export restrictions may have substantial consequences for global welfare.

This paper is organized as follows. Section 2 describes a range of policy objectives that might lead countries to institute these measures and it illustrates their potential implications for global welfare. Section 3 summarizes the WTO regulation dealing with the issue and briefly reviews the previous GATT and WTO disputes involving export restrictions. Section 4 offers a detailed analysis of the *China–Raw Materials* case which illustrates how China imposes quantitative restrictions and export taxes. This section attempts to clarify the extent to which these measures might be related to environmental protection, or be used as a disguised restriction on trade. Section 5 examines the potential implications of China's 'WTO-plus' commitments in this field. Section 6 offers a brief conclusion.

2. Export restrictions and their welfare implications

Both developing and developed countries resort to export restrictions which can take the form of export taxes, quantitative restrictions (through quotas and licences), and outright export bans. As a form of market distortion, these restrictions change the terms of trade and shift economic rents. As compared to other policy alternatives, such as direct support/subsidies or income taxes, it is often

1 WTO (2010a).

2 See Bradsher (2010), Hook and Dickie (2010), Leggett (2010).

3 WTO-plus commitments are defined as the Protocol commitments – which new entrants to the WTO are often required to undertake – that are more stringent than those of original WTO Members.

argued that export restrictions are not the most effective policy tools to achieve distributional objectives (WTO, 2010b). On the other hand, some countries impose them to address market failures, especially in the field of environmental protection (Korinek and Kim, 2009).

In the agricultural sector, export restrictions are applied to maintain domestic food supplies and achieve food security, especially in the face of the risks of tight supply conditions in relatively 'thin' international markets.⁴ In the industrial sectors, export restrictions often serve the objective of promoting downstream processors and manufacturers. By restricting the exports of certain raw materials, a country can lower input prices for downstream sectors, which in turn gives it a price advantage in export markets for processed and manufactured goods.

However, export restrictions result in net welfare losses for both the country imposing the export restriction and for the rest of the world by driving a wedge between the domestic and border prices. The potential impacts vary depending on the demand and supply elasticities of the commodity, the specific measure in question and on who appropriates the rent (difference between the domestic and border prices). In the country imposing export restrictions, the consumers of the restricted product would benefit from lower than pre-export restriction prices. However, the aggregate loss of producer welfare would exceed consumers' gains from the measure (i.e. deadweight cost of market distortion). It may also lead to various inefficiencies in allocation of resources as it may promote sectors which do not have comparative advantage.

Export restrictions also undermine traders' confidence in the world trading system – as they distort trade and create or aggravate short-term price volatilities (von Braun, 2008; WTO, 2010b). The restriction measures that seek to insulate domestic prices from changes in world market prices (e.g. in the agricultural sector), or to gain strategic advantages by limiting the supply of critical raw materials have a destabilizing effect on world prices, which in turn offsets the benefits that countries seek to gain from these measures.

Countries may also impose export restrictions for environmental reasons. Since markets for environmental goods and services are not fully developed, if they exist at all, market prices do not reflect the social value of environmental goods, such as fisheries, forestry, minerals, and fresh water.⁵ Mining is a case in point – as by-products of extracts and various inputs used in mining operations could be highly contaminating.⁶ Hence in a highly export-oriented sector, export restrictions, *in*

4 Global agricultural markets are 'thin' in the sense that only a small share of global farm production is traded internationally, which increases the risk of price instability in cases of disruption in supplies. See Anderson (2010).

5 Water in the form of 'virtual water' – total amount of water used in production of a commodity – could also be seen as exhaustible if it is traded. See Hoekstra (2010).

6 For instance, mining sites in China, India, Peru, Russia, and Zambia have been identified as some of the world's most environmentally polluted areas – as contamination of the air, water, and soil in these areas substantially exceeds the safety limits. See Blacksmith Institute (2007).

conjunction with other domestic measures limiting production and consumption, could help correct market failures that lead to environmental degradation and unsustainable resource depletion. Nevertheless, depending on the objective and the nature of the environmental externality to be targeted, various policy tools could be employed to restrict production rather than trade, which could be equally or more effective than export restrictions and potentially less.⁷ However, low-income countries often have better capacity to control trade than to control domestic production and consumption, and the introduction or increase of production taxes instead of export taxes may encourage firms to evade production taxes by relocating to the informal sector (Emran and Stiglitz, 2005). Hence in those countries, administering export restrictions is a second best, yet more feasible, policy option to target environmental externalities.

3. WTO regulation on export restrictions

The WTO regulation dealing with export restrictions is relatively limited, offering ample ‘policy space’ for domestic policy considerations. The most relevant legal texts in this context are GATT XI and Article 12 of the Agreement on Agriculture (AoA). GATT XI requires Members to eliminate all prohibitions and quantitative restrictions on exports. As for export restrictions aimed at environmental protection, violating GATT XI can be excused if restrictions qualify for an exception under Article XX. Article 12 of the AoA mirrors GATT XI, yet also requires Members to give written notice to the Committee on Agriculture, and to consult with Members who are likely to be affected by their export restrictions. GATT XI does not restrict Members to imposing export taxes (Crosby, 2008), but if they are applied at levels which are *de facto* prohibitive, they might be considered as measures amounting to export bans, which would violate Article XI.

On the other hand, some new WTO Members, such as China, Mongolia, Saudi Arabia, and Ukraine, were required, during their accession negotiations, to commit themselves to stricter rules, so called ‘WTO-plus’, which restrict their ‘policy space’ in this field. Although the scope and the scale of their commitment varied, they were obliged to phase out export taxes or to limit them to a designated number of tariff lines with a bound rate (Crosby, 2008). Hence it may be argued that the WTO law in relation to export restrictions is biased against the late accession Members, including China.

The DSB’s interpretation of export restrictions

Few cases relating to export restrictions have been brought before the WTO/GATT Dispute Settlement Body. In all cases, the disputes involved accusations that the export restrictions had been designed to offer some form of advantage to the

⁷ See Balistreri and Worley (2009) for an example of how alternative policies to exports restrictions could result in lower welfare losses in the case of those imposed on mercury for environmental reasons.

downstream producers and processors of the country instituting the measure, at the expense of the downstream sectors in complainant countries.⁸ Only in one resolved case, *Canada–Salmon*, did the defendant resort to the environmental exceptions under GATT XX (see below).

The case of *Canada–Salmon* is highly relevant in the context of the *China–Raw Materials* examined below. In this case, the disputed regulation was part of Canada's fishery legislation stating that 'No person shall export from Canada any sockeye or pink salmon unless it is canned, salted, smoked, dried, pickled or frozen.' The complainant, the US, claimed that this was a clear violation of Article XI. It alleged that the disguised objective of the measure in question was to promote the downstream processor sectors in Canada, at the expense of the processors in neighbouring areas in the US territory.⁹ However, Canada claimed that the measures under dispute were part of its fisheries conservation and management regime and hence justified under Article XX(g), which allows for restrictive measures if they are 'relating to' the conservation of exhaustible natural resources.

In this case, the Panel examined whether these measures could be justified by Article XX(g). It first assessed the meaning of the terms 'relating to' and 'in conjunction with' as stated in Article XX(g). Its interpretation was that for a trade measure to be considered as 'relating to', it had to be primarily aimed at conservation of exhaustible resources. It also stated that a trade measure could only be considered to be 'in conjunction with' production or consumption restrictions if 'it was primarily aimed at rendering effective these restrictions'.¹⁰

Then the Panel examined whether the Canadian regulation could satisfy these criteria. It found that, affirming the US argument, the Canadian fishery regulation which restricted domestic production (i.e. harvesting) covered other fish varieties which were not subject to export prohibitions. In addition, the export prohibitions only applied to supplies in unprocessed form and did not cover exports of the same varieties in general. The Panel also found that these measures restricted purchases of these commodities only by foreign processors and consumers and not those made by domestic processors and consumers. Hence it concluded that 'these prohibitions could not be deemed to be primarily aimed at the conservation of salmon and herring stocks and at rendering effective the restrictions on the harvesting of these fish'. So it determined that the export prohibitions imposed by Canada violated Article XI and could not be justified under Article XX(g).¹¹

The two other major disputes concerning export restrictions were the *Japan–Semiconductors*¹² and the *Argentina–Hides and Leather* cases.¹³ The *Japan–Semiconductors* case involved a component dealing with 'export restrictions'

8 For example, see GATT (1988a); WTO (2001a).

9 GATT (1988b), para. 3.11.

10 GATT (1988b), para. 4.6.

11 GATT (1988b), para. 4.7.

12 See GATT (1988a).

13 See GATT (1988b).

allegedly imposed by Japan. The Panel in this case concluded that Japan exerted various forms of pressure on the private sector to eliminate the sale of selected semi-conductors below company-specific prices, which substantially restricted their exports, hence violating Article XI.¹⁴ The *Argentina–Hides and Leather* dispute investigated the EC's complaint about measures taken by Argentina on the export of bovine hides.¹⁵ The EC alleged that Argentina had imposed a *de facto* export prohibition on raw and semi-tanned bovine hides which allegedly violated GATT Article XI:1.¹⁶ However, the Panel concluded that the EC had not offered satisfactory evidence to illustrate how the Argentinean regulation in question would violate Article XI.¹⁷

4. *China–Raw Materials case*

In December 2009, the Dispute Settlement Body established a panel to examine complaints by the US, the EU, and Mexico concerning China's export restrictions on selected minerals. The commodities in question were bauxite, coke, fluor spar, magnesium, manganese, phosphate (yellow phosphorus), silicon (metal and carbide), and zinc. The complainants alleged that China's policies regarding the exportation of these commodities are inconsistent with its obligations under Article VIII, Article X, and Article XI of the GATT 1994 and the Protocol on the Accession of the People's Republic of China ('Accession Protocol') (WTO Secretariat, 2001b) and the Working Party Report on the Accession of China (WTO, 2001c).

The complainants' case rests upon three pillars (WTO, 2009a): (a) China imposes quantitative restrictions on the commodities in question; (b) it imposes export duties on them; (c) it resorts to other constraints on the exportation of these commodities, through fees and excessive formalities which are applied 'in a manner that is not uniform, impartial, and reasonable'. The following section looks at the first two components of the case. The third component, which is related to China's administrative measures, albeit relevant, goes beyond the scope of this paper.¹⁸

Domestic production and trade

China is a major producer and exporter of the majority of these commodities which are often strategically important for a range of manufacturing sectors (see Table 1 for a range of applications). As shown in Table 1, between 2002,

¹⁴ GATT (1988a), para. 117.

¹⁵ WTO (2001a).

¹⁶ In this case, the EC also alleged that Argentina had violated GATT Article III by imposing an 'additional value added tax' and an 'advance turnover tax' on the price of imported finished leather.

¹⁷ WTO (2001a), para. 11.55.

¹⁸ As of March 2011, the decision of the Panel regarding this case had not been published. Therefore the analysis undertaken in this section is based on the existing jurisprudence and the data that are publicly available, and hence may not necessarily reflect the actual proceedings of the Panel's investigation.

Table 1. Industrial applications, production trends and share in world production of selected minerals in China

Applications		2002 (000 tons)	2008 (000 tons)	2002–2008 growth (%)	Share in world production (%)
Bauxite	Main source of aluminium, which is widely used in packaging, transportation, building, electrical and consumer durables	12,000	32,000	167	31
Fluorspar	Used in production of hydrofluoric acid, which is used in the electroplating, stainless steel, refrigerant, and plastics industries.	2,450	3,200	31	55
Magnesium Compounds	Used in refractories and in agricultural, chemical, construction, environmental, and industrial applications	1,070	2,000	87	45
Magnesium Metal	A constituent of aluminium-based alloys that are used for packaging, transportation, and other applications	230	700	204	87
Manganese	Used in steel production, pig iron manufacture and in upgrading ore to ferroalloys. Also used in dry cell batteries, plant fertilizers and animal feed	900	2,800	211	21
Phosphate	Mined to manufacture phosphoric acid and superphosphoric acid, used in fertilizers, animal feed supplements, food additives and industrial applications	23,000	50,000	117	30
Silicon	Used by producers of aluminium and aluminium alloys, the chemical industry, and the semiconductor industry	1,500	3,300	120	58
Zinc	Used in galvanising, in zinc-based alloys, and in brass and bronze. Zinc compounds and dust are used by the agriculture, chemical, paint, and rubber industries	1,550	3,200	106	28

Coke: 270400

when China joined the WTO, and 2008, the volume of production of all of these minerals has grown substantially (USGS, 2010). In 2008, China's share in world production of the minerals listed above was reported to range between 28 % for zinc and 87 % for magnesium metal. As such, China is a major, and in some cases the biggest, producer of these commodities.¹⁹

The picture for trade flows and volumes, however, is different. For some minerals, China is a major exporter, and for others, it has become a major importer, despite also being a major producer. The volume of its exports has fluctuated over the past few years. Between 2002 and 2008, the export volumes of silicon and magnesium increased considerably. The biggest rise was in silicon exports which grew by 90 %. As of 2008, among the listed minerals, the highest market shares held by China were for silicon and magnesium, each amounting to about 45 % of total world exports. It is clear that China controls a substantial share of world markets in these commodities (see Table 2) (UnComtrade, 2010). By contrast, the exports of some other minerals have declined considerably. The biggest drops were seen in exports of bauxite and zinc (82 % each). China has become a major

¹⁹ Due to data source incompatibility, the table excludes coke, which is not a mineral. It is a solid carbonaceous residue derived from low-ash, low-sulfur bituminous coal. It is reported that China's coke output amounted to 327 million tons in 2008, constituting a share of over 60 % of the world's total production. See China International Coking Technology and Coke Market Congress (the 8th).

Table 3. Total export quota (thousand metric tons) for selected industrial products in China, 2009–2010

Commodity Name	Quota Amount	
	2009	2010
Bauxite	930	930
Fluor	550	550
Carborundum (Silicon carbide)	216	216
Light (heavy) calcined magnesite (Magnesium carbonate)	1,400	1,330
Phosphorite		1,500

Source: Ministry of Commerce (2008).

importer of these minerals. For example, between 2002 and 2008, the volume of its bauxite imports grew by approximately 2,400%, from 1.1 million metric tons to more than 28 million metric tons (UnComtrade, 2010).

Export restrictions

The imposition of export restrictions on a range of commodities has long been part of China's trade policy. The list of items subjected to various forms of export restrictions goes beyond the minerals listed in the *China–Raw Materials* case. A number of agricultural products (timber, cattle, chemical fertilizers), and other minerals, such as molybdenum, chromium, and rare earth metals are commodity groups which have been subject to export restrictions. For clarity of the analysis, however, the section below focuses on the minerals mentioned in the case.

Quantitative restrictions on exports

The first component of the case against China challenges the WTO compatibility of these quantitative restrictions. Based on the official announcements of China's Ministry of Commerce, five of the commodity groups listed under industrial products are mentioned in the case – namely bauxite, fluor, silicon carbide, magnesium, and phosphorite (see Table 3) – are subject to export quotas in 2009 and 2010 (Ministry of Commerce, 2008). However, it is important to note that some of these export quotas, for instance for bauxite, are not fully utilized by exporters.

It is clear that, unless justified by exceptions, the mere existence of these measures is inconsistent with GATT XI:1. Moreover, Paragraph 162 of the Working Party Report refers to export restrictions and provides that 'China would abide by WTO rules in respect of non-automatic export licensing and export restrictions ... Moreover, export restrictions and licensing would only be applied, after the date of accession, in those cases where this was justified by GATT provisions.' As such, before going into an analysis of the possibility of exceptional

conditions which may allow these measures, it is clear that China's quantitative export restrictions violate its commitments under GATT XI and the Accession Protocol.

Export taxes

The second component of the case is about export taxes. China resorts to export taxes quite extensively. According to the 'Circular of the Customs Tariff Commission of the State Council on the Tariff Execution Plan 2010', a total of 329 tariff lines (8-digit Harmonized System (HS)) are subject to export taxes, which are applied in the form of 'export tariffs', and/or 'interim tariffs' and/or 'special export tariffs'. All of the minerals mentioned in this case are listed in the Tariff Execution Plan 2010 (ETCN, 2010). Ranging from 5% for magnesium oxide to 40% for coke, various degrees of export taxes are imposed (see Table 4).

In relation to the WTO compatibility of its export taxes, which is under dispute, China faces significant constraints arising from its accession commitments rather than its obligations under GATT, which allows Members to impose export taxes. Its Accession Protocol explicitly limits the number of items and the level of export taxes that China is allowed to impose. According to Article 11.3 of the Accession Protocol, 'China shall eliminate all taxes and charges applied to exports unless specifically provided for in Annex 6 of this Protocol or applied in conformity with the provisions of Article VIII of the GATT 1994' (WTO, 2001b). Accordingly, Annex 6 lists a total of 84 tariff lines (8-digit HS), with maximum levels of export duties. China also confirmed that it would maintain the applied rates imposed at the time of the agreement and would consult with its trade partners who would potentially be affected if, under 'exceptional circumstances', it had to increase its applied rates (still not to exceed the maximum level indicated in Annex 6).²⁰

In order to establish whether China complies with its commitments under the Accession Protocol, the question is whether China imposes export duties on commodities which are not listed in Annex 6, and whether it exceeds the maximum levels designated in Annex 6. As indicated in Table 4, China imposes export taxes on a number of minerals that are not listed in Annex 6 (for example, nine forms of magnesium, two forms of fluor spar, and coke).²¹ Also, the export taxes on some of the minerals that are listed in Annex 6 exceed the maximum rates indicated (for example, 'unwrought aluminum alloy'). It should also be noted that China revises its export taxes quite often, apparently following trends in prices and the demand and supply situation related to the commodity in question (China Chemical Reporter, 2009).

²⁰ See WTO (2001b), Annex 6, at 95.

²¹ China also imposes export taxes on some sub-products of minerals, which are listed in Annex 6. For instance, although 'not allowed, unwrought Zinc (<99.99% pure)' and 'Zinc ores and concentrates' are allowed to be subject to export taxes, China imposes taxes on 'Zinc waste or scrap' and 'Ash or residues containing hard zinc spelter', which are not listed in Annex 6.

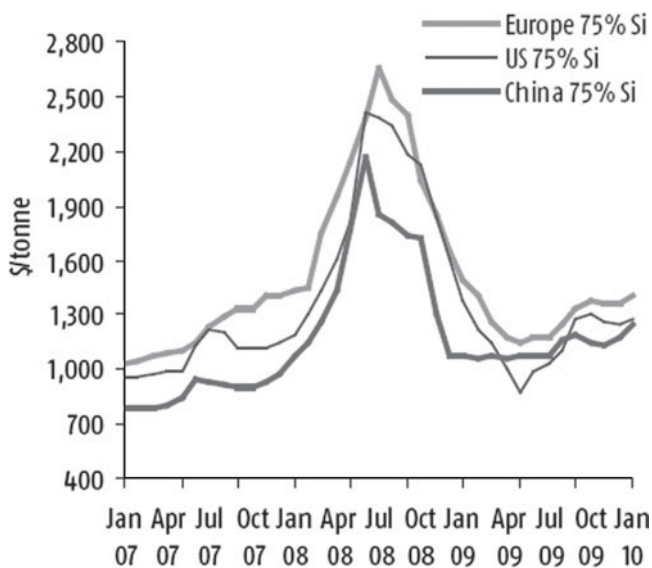

Table 4. Export taxes imposed on selected minerals by China, 2010

Product form		Export tariff	Interim tariff	WTO accession annex 6
Bauxite	Aluminium unwrought, not alloyed, >99.95% pure	30%	0%	
	Aluminium unwrought, not alloyed, <99.95% pure	30%	15%	
	Unwrought aluminium alloy	30%	15%	30%
	Waste or scrap, aluminium	30%	15%	30%
Fluorspar	Fluorspar, >97% calcium fluoride		15%	
	Fluorspar, <97% calcium fluoride		15%	
Magnesium	Magnesium unwrought >99.8% pure		10%	
	Magnesium unwrought		10%	
	Magnesium waste or scrap		10%	
	Fused magnesia		10%	
	Dead-burned magnesia		10%	
	Light-burned magnesia		5%	
	Natural magnesium carbonate (magnesite)		5%	
	Magnesium oxide		5%	
	Other mineral products with 70% or more magnesia		5%	
Manganese	Manganese ores, concentrates, iron ores >20% manganese		15%	
	Manganese, articles thereof, waste or scrap	20%		20%
	Ferro-manganese, >2% carbon	20%		20%
	Ferro-silico-manganese			
Phosphate	Natural calcium phosphates, unground		35%	
	Natural calcium phosphates, ground		35%	
	Yellow phosphorus	20%		20%
	Other phosphorus	20%	10%	20%
Silicon	Silicon, <99.99% pure		15%	
	Ferro-silicon, >55% silicon	25%		25%
	Ferro-silicon, <55% silicon	25%		25%
Zinc	Zinc, not alloyed, unwrought, >99.995% pure	20%	0%	
	Zinc, not alloyed, unwrought, >99.99% pure, <99.995% pure	20%	5%	20%
	Zinc, not alloyed, unwrought, <99.99% pure	20%	15%	
	Zinc waste or scrap	30%		30%
	Zinc ores and concentrates		10%	
	Ash or residues containing hard zinc spelter		10%	
	Ash or residues containing mainly zinc (not spelter)			
Coke	Coke, semi-coke of coal, lignite, peat & retort carbon		40%	

Notes: Export tariffs are the generally applicable rates; 'interim' tariffs are applied for a defined period of time (e.g. high season), and generally valid for one year. The Government reviews interim tariffs and adjusts them as it deems necessary. It can also set 'special' tariffs in response to special circumstances. According to the Regulations of the People's Republic of China on Import and Export Duties (Article 11) 'In cases where export goods, to which export tariff rates are applicable are subject to temporary tariff rate, the temporary tariff rate shall apply.'

Figure 1. Ferro-silicon prices, China, Europe, US, 2007–2010

Source: Metal Bulletin Research (2010).

The fact that China's 'Tariff Commission of the State Council on the Tariff Execution Plan 2010', includes 329 items while Annex 6 of its Accession Protocol includes only 84 items (both 8-digit HS), illustrates that the coverage of China's export taxes goes beyond the list of commodities designated in Annex 6, and they often exceed the levels to which China committed itself with its Accession Protocol.²²

Favouring downstream sectors?

The impact of these measures on domestic prices is particularly apparent when considering those minerals of which China is a major exporter. For instance, the domestic prices of minerals such as ferro-silicon, silicon metal, and ferro-manganese, of which China is one the world's biggest producers and exporters, have been consistently lower than the international prices. As is shown in Figure 1, between February 2007 and February 2010, domestic prices of ferro silicon (75 % pure) were significantly lower than those in the Western markets, namely

²² China also uses differing rates for value-added tax (VAT) rebates for exports. The amount of refund that exporters are entitled to receive depends on the VAT refund rate specified for different categories of exports. Hence it may range from 0% to 17% and is subject government reviews (Global Tax Watch, 2010). Commodities such as steel and nonferrous metal products are subject to lower levels of VAT refund, mainly because of the Government's policies that aim to promote domestic industries. It may be argued that these measures amount to export restrictions. However the complainants of the *China-Raw Materials* case did not refer to them when making their case against China's export restrictions.

Europe and the US (Metal Bulletin Research, 2010). Similar price differentials between domestic and international prices exist in other minerals, such as silicon metal and ferro manganese. Such price differentials, which might be partly a result of export restrictions, clearly offer significant price advantages to the domestic downstream manufacturing sectors over foreign producers, which is one of the main concerns of the countries which brought the case before the DSB.

Conservation of natural resources?

Given that its export restriction measures appear inconsistent with its commitments under GATT 1994 and the Accession Protocol, China will have to demonstrate that its measures satisfy certain exception(s) under Article XX of GATT 1994. As the Appellate Body explicitly clarified during the recent *China–Publications and Audiovisual Products* case, there is no doubt that China may invoke GATT Article XX to excuse itself from its commitments under its Accession Protocol.²³ In fact, responding to the panel request by the complaining parties, some Chinese officials have already indicated that the objective of these policies was related to environmental protection.²⁴ In that case, China will have to demonstrate that its export restriction measures satisfy the requirement of ‘relating to’ the conservation of natural resources in the meaning of GATT Article XX, paragraph (g), and that its measures operate ‘in conjunction with restrictions on domestic production or consumption’, i.e. that they are in line with the so-called ‘even-handedness requirement’. In addition, China will have to demonstrate that these measures do not constitute ‘a disguised restriction on international trade’ as mentioned in the ‘chapeau’ of Article XX.²⁵

Environmental regulation of mineral production in China

The Environmental Protection Law of China defines the ‘environment’ as ‘the total body of all natural elements and artificially transformed natural elements affecting human existence and development, which includes the atmosphere, water, seas, land, minerals, forests, grasslands, wildlife, natural and human remains, nature reserves, historic sites and scenic spots, and urban and rural

23 The Panel, in this case, did look, on an *arguendo* basis, at whether China’s measures in question could be justified under GATT Article XX(b). Since it concluded that the measures did not qualify for an exception satisfying the requirements of GATT Article XX, the Panel decided that it was not necessary for it to determine whether China has the right to invoke GATT Article XX in cases of inconsistency with its Accession Protocol. However the Appellate Body decided to clarify this ambiguity and concluded that China’s right to invoke GATT Article XX also covers its commitments under its Accession Protocol. WTO (2009b), para. 7.745; WTO (2009c), para. 415(a).

24 The Chinese Ministry of Commerce’s comment on the establishment of the Panel was ‘The goal of export administrative measures on some raw materials is to protect the environment and our limited resources.’ ‘The regulations conform to the needs of China’s own (sustainable) development, while also advancing China’s efforts towards the sustainable development of the global economy.’ See *EU Business* (2009).

25 Article XX(g) reads ‘Relating to the conservation of exhaustible natural resources if such measures are made effective in conjunction with restrictions on domestic production or consumption.’

areas'.²⁶ As such, protection of minerals, as part and parcel of the environment, could be classified as environmental protection under domestic law. This is particularly relevant in the context of China's Foreign Trade Law – as it allows for restrictions and bans on the imports and exports of goods in order to protect, among other things, the environment (Article 16(2)).²⁷

However China's domestic environmental regulation specifically addressing production of minerals is highly fragmented. There are a number of laws dealing directly or partly with environmental issues related to mining operations. The Mineral Resources Law requires mining enterprises to have a report on the 'mining area, its mining design or mining plan, production and technological conditions and safety and environmental protection measures' with an examination and approval by relevant State authorities (Article 15).²⁸ The Law on Water and Soil Conservation requires mining enterprises to have a water and soil conservation programme which is approved by the Department of Water Administration (Article 19).²⁹ The Law of the Prevention and Control of Water Pollution, on the other hand, requires those responsible for underground mining operations to take protective measures against groundwater pollution (Article 35).³⁰

Although government authorities may decline to grant permission for production on sites or for operations that may lead to environmental damage, these measures cannot be considered as direct restrictions on production intended to protect or to prevent the depletion of minerals as environmental resources. Moreover, it has been argued that the implementation and enforcement of these regulations have been highly problematic. Complicated institutional and regulatory structures and inconsistencies of implementation have been reported as major causes of a range of environmental damage, high numbers of casualties among miners and economic inefficiencies in small-scale mining operations (Cao, 2007; Andrews-Speed *et al.*, 2003; Wright, 2004).

Resource tax

There is one measure, however, which is directly aimed at production: the Resource Tax. It is a quantifiable measure which acts as a disincentive to production through a 'market mechanism'. It is directly imposed on production of non-metal ores, crude oil, natural gas, coal, and solid salt, in the case of non-metal ores, depending on the type of mineral, its grade (purity), and the location of production, different tax rates apply. Among the listed minerals under dispute, the resource tax is Rmb 20.00/ton (US\$ 2.9/ton) for bauxite (grade 3); Rmb 2/tonne (US\$ 0.3/ton) for manganese ore; and Rmb 2–4 (US\$ 0.3–0.6/ton) for zinc ore

26 See Environmental Protection Law of China Article 2.

27 See Foreign Trade Law of the People's Republic of China Article 16.

28 See Mineral Resources Law of the People's Republic of China.

29 See Law of the People's Republic of China on Water and Soil Conservation.

30 See Law of the People's Republic of China on the Prevention and Control of Water Pollution.

(grades 1–5) (State Administration of Taxation, 2010). However, these market measures are relatively insignificant when compared to the overall value of production. In March 2010, they amounted to less than 1 % of the price of bauxite, less than 0.5 % of the price of manganese ore, and less than 0.1 % of the price of zinc respectively (Asia Metal, 2010; Commodityonline, 2010; Firstbauxite, 2010). Hence the current design and implementation of the Resource Tax does not seem to offer an effective mechanism to curb production and conserve minerals, albeit allowing local provinces to raise tax revenues.³¹

Mineral-specific environmental measures

The Government takes some other mineral-specific measures, directly or indirectly related to the environment, which affect the mining sector (China Mining Association, 2010). For example, it imposes limitations on electricity consumption for mineral production and processing which constrains production and hence affects prices (USGS, 2008). The government has also introduced a set of standards regarding the scale and the potential for pollution of production and processing facilities of some minerals, such as lead, magnesium, manganese, and zinc. In 2008, according to the China Magnesium Association, 18 magnesium plants with high energy consumption and pollution intensity (as a result of relying on direct coal combustion) were closed down (China Magnesium Industry, 2007). However, since the total volume of mineral production by such small-scale operators is relatively low, such closures were not expected to reduce total production significantly (TEX Report, 2007).

5. WTO-plus commitments

It is highly likely that China will have difficulty in demonstrating that its export restrictions in the context of its environmental regulation satisfy the requirements of Article XX(g). First, although the Appellate Body's interpretation of the 'relating to' facet of Article XX(g) is less strict than the GATT jurisprudence requiring the measures in question to be 'primarily aimed at' rendering effective the restrictions on domestic production and consumption,³² China still has to establish that its export restrictions are 'reasonably related' to the policy goal of conservation of exhaustible natural resources. However, as indicated above, its measures do not appear to be part of its highly fragmented environmental regulation dealing with mineral production. It would be difficult to establish that the measures in question are 'fairly narrowly focused'.

Secondly, whether or not the measures concerned are applied 'in conjunction with restrictions on domestic production or consumption' (the even-handedness

³¹ There have been reports that the policy has been under revision and tonnage-based taxation will be changed to a floating system where the tax rate will be based on the price of the minerals targeted. See Reuters (2010).

³² See GATT Dispute Settlement Report (1988b).

requirement), there are difficulties too. They seem to impose restrictions, just in respect of the exports of the minerals in question, not with respect to domestic production and consumption. As such they restrict only purchases of these minerals by foreign processors and consumers and not those made by domestic processors and consumers. In addition, these restrictions apply only to supplies in unprocessed form and do not cover exports of processed products which are composed of the raw materials in question. On the other hand, the above-mentioned restrictions on domestic production (e.g. the resource tax), or the product specific environmental measures cover other natural resources which are not subject to export restrictions. Hence, it is unlikely that the measures concerned would satisfy the even-handedness requirement. For the next step of the examination as to whether or not they would satisfy the chapeau of Article XX (i.e. that they are not ‘a disguised restriction on international trade’), the measures have to pass the first tier of the analysis (i.e. ‘relating to’ and the ‘even-handedness requirement’).

In the *Canada–Herring and Salmon* case, environment-related exceptions under GATT Article XX were not found to be applicable. Such an outcome is highly likely for the *China–Raw Materials* case too. This is mainly because the DSB is likely to judge that the environmental component/objective of the measures in question was relatively weak compared to their economic component/objective with a restrictive impact on trade.

The *China–Raw Materials* case will be a show case to exemplify the extent to which China’s WTO-plus commitments might constrain its economic and environmental policy considerations in the near future. It is clear that WTO law regarding export restrictions shows signs of disproportionality. Although it is arguably an area of ‘under-regulation’ or ‘regulatory deficiency’ in WTO law (see Section 3 above) – as it offers Members ample ‘policy space’ for domestic policy considerations – it is biased against the late accession Members, the majority being developing countries such as China, which have had to commit themselves to stricter rules. Hence unlike other Member countries, China is likely to face legal action if it resorts to using export restrictions for the objective of promoting downstream processing and manufacturing sectors. These stricter rules may also constrain its policy options in addressing various environmental concerns through export restrictions.³³ Although Article XX provides some leeway, this comes with significant limitations and compliance requirements.

6. Conclusions

Like most of the other GATT/WTO cases on export restrictions, the latest dispute between China and the US, EU, and Mexico could be seen as another example of

³³ Some analysts argue that the accession negotiations were not used to improve sustainable development (Charnovitz, 2007).

competition over natural resources. It involves alleged 'unfair' advantages that the measures have created for the downstream producers and processors in China, at the expense of the downstream sectors in complainant countries. For the complainants, the primary motivation seems to be the objective of obtaining greater access to raw materials. As the world economy is recovering from the current slowdown and the international competition over raw materials is picking up again (reflected in rising prices), China is likely to face growing resistance if it resorts to using export restrictions. There might be other similar dispute cases filed against China being brought before the DSB. As such, export restriction is an area where China might feel the implications of its so called 'WTO-plus' commitments on its domestic and trade policies.

Problems of 'unfair' competition and related global welfare losses would be substantial if China, which is a major supplier of many commodities with limited substitution possibilities, continues to resort to export-protectionist measures (or 'resource nationalism'). Similarly, in the case of thin market conditions (e.g. certain strategic minerals), its supply constraints combined with export restrictions could inflate prices rapidly, to the detriment of net importing countries. This would also undermine the confidence in the multilateral trading system. It is important to note that as a major trading country which has been relying heavily on export-oriented growth, maintaining the stability and the predictability of the multilateral trading system is in the interest of China's long-term prosperity. Hence, China has a strong interest in avoiding policies that would create additional volatility in global markets and damage global welfare.

As for its legitimate environmental and social concerns, Chinese policy makers will need carefully to weigh the effectiveness and the potential benefits of export restrictions against the welfare losses they cause and consider the alternative tools at their disposal. There seem to be significant discrepancies between the environmental policy objectives that might be intended to be achieved through export restrictions and the actual impact on the ground. Depending on the objective and the nature of environmental externalities, various other policy tools could be employed and be equally as effective or more so than export restrictions and would also be potentially less costly in terms of global welfare losses.
