Source/Description: HPR3Z is a 1.6 kb human growth hormone releasing hormone (GHRH) receptor cDNA clone described by Mayo (1) inserted into pGEM7Z. Sense: cut with *HindIII*, use SP6; antisense: cut *BamHI*, use T7 polymerase.

Polymorphism: *BamHI* identifies a two allele polymorphism with bands either at 2.6 kb (A1) or 2.4 kb (A2) and an invariant band at 8.5 kb.

Frequency: Studied in 48 unrelated healthy Caucasians.

A1 = 0.72

A2 = 0.28

Calculated heterozygosity = .40.

Not Polymorphic For: *EcoRI*, *PvuII*, *PstI*, *BglI*, *BglII*, *BclI*, *HindIII*, *HincII*, *MspI* and *FocI*.

Chromosomal Localisation: Human GHRH receptor (GHRHR) has been mapped to chromosome 7p14 (2).

Mendelian Inheritance: Co-dominant inheritance of alleles A1 and A2 was observed in 29 individuals from 5 families.

Probe Availability: Probe available on request from K.E.Mayo, Department of Biochemistry, Molecular Biology, and Cell Biology, Northwestern University, Evanston, IL 60208, USA.

Acknowledgements: This work was supported by grants from Swiss National Science Foundation (32-33535.92) and Pharmacia (Switzerland). We thank K.E.Mayo for supplying the HPR3Z probe.
