The role of B- and T-cell immunity in toltrazuril-treated C57BL/6 WT, μMT and nude mice experimentally infected with *Neospora caninum*

In the Materials and methods section on page 179, we stated that:

For a daily uptake of approximately 20 mg toltrazuril/kg body weight, 62.5 mg toltrazuril/100 ml water was given. The average water consumption was estimated as 0.6 ml/day for each mouse, so approximately 0.42 mg toltrazuril was ingested daily.

The text should read:

For a daily uptake of approximately 80 mg toltrazuril/kg body weight, 62.5 mg toltrazuril/100 ml water was given. The average water consumption was approximately 3 ml/day for each mouse, so approximately 1.85 mg toltrazuril was ingested daily.
