A coding error was found and corrected in the implementation of the leaf energy storage, causing an underestimation of this storage. A corrected version of the code can be found at: [https://github.com/RonnyMeier/ctsm/tree/ERL-106754\\_corrected](https://github.com/RonnyMeier/ctsm/tree/ERL-106754_corrected). For any future work, please use the code from this repository instead of the repository mentioned at the end of section 2.1 on page 3.

After this correction, the diurnal range of the biomass heat flux in figure 1 is increased by  $3.98 \text{ W m}^{-2}$  on average (area-weighted mean, figure C1). The impact on temperature, however, is very limited and the main conclusions of the study remain unchanged (figure C2; Note that the values on the color scale of this figure are a factor of 10 smaller than the values of figure 2 in the original manuscript).
