# IgA<sup>+</sup> memory B cells are significantly increased in patients with asthma and small airways dysfunction

Anika Habener, Ruth Grychtol, Svenja Gaedcke, David DeLuca, Anna Maria Dittrich, Christine Happle, Mustafa Abdo, Henrik Watz, Frauke Pedersen, Inke Regina König, Dominik Thiele, Matthias Volkmar Kopp, Erika von Mutius, Thomas Bahmer, Klaus Friedrich Rabe, Almut Meyer-Bahlburg, Gesine Hansen,

Please cite this article as: Habener A, Grychtol R, Gaedcke S, *et al.* IgA<sup>+</sup> memory B cells are significantly increased in patients with asthma and small airways dysfunction. *Eur Respir J* 2022; in press (https://doi.org/10.1183/13993003.02130-2021).

This manuscript has recently been accepted for publication in the *European Respiratory Journal*. It is published here in its accepted form prior to copyediting and typesetting by our production team. After these production processes are complete and the authors have approved the resulting proofs, the article will move to the latest issue of the ERJ online.

Take home message

Circulating B cells are altered in asthma patients. Especially, IgA+ memory B cells are

significantly increased in patients with impaired lung function particularly of the small

airways thus suggesting a contribution to inflammation in the peripheral lung.

**Total word count: 3533** 

**Abstract** 

**Background:** Comprehensive studies investigated the role of T cells in asthma leading to

personalized treatment options targeting severe eosinophilic asthma. However, little is known

about the contribution of B cells to this chronic inflammatory disease. In this study, we

investigated the contribution of various B cell populations to specific clinical features in

asthma.

Methods: In the All Age Asthma Cohort (ALLIANCE) a subgroup of 154 adult asthma

patients and 28 healthy controls were included for B cell characterization by flow cytometry.

Questionnaires, lung function measurements, blood differential counts and allergy testing of

participants were analysed together with comprehensive data on B cells via association

studies and multivariate linear models.

**Results:** Patients with severe asthma showed decreased immature B cell populations while

memory B cells were significantly increased compared to both mild-moderate asthma patients

and healthy controls. Furthermore, increased frequencies of immunoglobulin A positive

(IgA<sup>+</sup>) memory B cells were associated with impaired lung function and specifically with

parameters indicative for augmented resistance in the peripheral airways. Accordingly,

asthma patients with small airway dysfunction (SAD) defined by impulse oscillometry

showed increased frequencies of IgA+ memory B cells, particularly in patients with mild to

moderate asthma. Additionally, IgA+ memory B cells significantly correlated with clinical

features of SAD such as exacerbations.

Conclusions: With this study we demonstrate for the first time a significant association of

increased IgA+ memory B cells with asthma and SAD, pointing towards future options for B

cell-directed strategies in preventing and treating asthma.

### Introduction

Asthma is one of the most prevalent chronic respiratory diseases characterized by airway inflammation, airway hyperreactivity and impaired lung function with obstruction of the central and peripheral airways [1, 2]. In the past decades, a better understanding of distinct phenotypes and endotypes of this heterogeneous disease supported the development of personalized therapeutic approaches, mainly directed against type 2 cytokines in severe eosinophilic asthma [3]. In contrast, knowledge of the impact of B cells on asthma is still very limited and mostly acknowledges their role in allergic asthma as IgE producers [4]. More recently, research revealed immunomodulatory functions of regulatory B cells on allergic airway inflammation [5] and allergen tolerance [6]. Additionally, we could show that B cells control airway hyperreactivity and airway remodeling in a murine asthma model [7], pointing towards a possible role of B cells for future diagnostic and preventive strategies in asthma. The peripheral B cell compartment consists of various populations ranging from immature so called transitional B cells to mature naïve B cells. Activation of naïve B cells leads to highly specialized antigen-experienced CD27<sup>+</sup> memory B cells or plasma cells producing immunoglobulin (Ig) M, A G, or E [8, 9]. Additionally, less antigen-specific and therefore polyreactive IgA is produced by CD27 memory B cells which play a role in mucosal hostmicrobiome homeostasis [10]. Memory B cells recirculate in blood, secondary lymphoid tissues [11] and mucosal organs such as the lung [12] and their reactivation results in a strengthened immunoglobulin response [11, 13].

In particular, IgA and IgA<sup>+</sup> B cells are crucial for pulmonary mucosal immune defense [14] and also show immunomodulatory properties [15]. Histology studies in chronic obstructive pulmonary disease (COPD) connected IgA<sup>+</sup> B cells and locally impaired secretion of IgA to inflammation of the small airways [16, 17]. This is of particular interest as inflammation and obstruction of the peripheral airways (bronchioles < 2 mm) is also an important clinical feature of asthma called small airway dysfunction (SAD) [18, 19]. SAD occurs in patients

with mild-moderate and severe asthma and significantly affects exacerbation rates, quality of life, and daily physical activity [20, 21]. While lung function and imaging correlates of SAD have been frequently investigated in recent years [18, 21], little is known about the inflammatory processes contributing to SAD due to the relative inaccessibility of the small airways for cellular specimen collection.

Based on our previous findings in experimental asthma mouse models [5, 7], we hypothesized that B cells influence asthma pathogenesis in humans and are linked to specific clinical characteristics in asthma patients. We therefore analysed immature, mature and memory B cells in peripheral blood of asthma patients and healthy controls of the All Age Asthma Cohort (ALLIANCE). We used supervised and unsupervised statistical methods to search for associations between specific B cell populations and essential clinical asthma features such as disease severity, markers of airway inflammation and lung function. Overall, we aimed to delineate the influence of B cells on inflammatory processes driving asthma pathogenesis or specific traits to address the existing knowledge gap about B cells and asthma and explore the potential of B cells for disease phenotyping and diagnostics to improve personalized asthma care.

#### Materials and methods

### **Subjects and sample collection**

B cell analysis was done in a subgroup with available blood specimen comprising 154 adult patients and 28 healthy controls of the ALLIANCE Cohort, a longitudinal multicentre clinical cohort of the German Center for Lung Research (DZL) recruiting children with preschool wheeze and asthma as well as adult asthma patients [22]. All local Medical Ethics Committees of the participating centres approved the study protocol and all participants gave their written informed consent. Adults were recruited at the DZL sites of the Airway Research Center North (ARCN). The study was registered at *clinicaltrials.gov* (adult arm:

NCT02419274). Study design, inclusion and exclusion criteria, detailed data and biomaterial collected at yearly study visits have been reported elsewhere [22]. Adult patients with asthma diagnosed according to international [23] and national guidelines [24] were eligible for inclusion as well as healthy controls without a previous asthma diagnosis and respective clinical symptoms. Further information concerning study design, methods, and definition of clinical variables are specified in the online data supplement.

#### B cell characterization

Isolated peripheral blood mononuclear cells (PBMCs) were used for phenotypic characterization of B cell subpopulations. Cells were blocked, stained and analyzed via flow cytometry. Further details are specified in the online data supplement.

### **Statistical Analysis**

The analysis was done using R (version 4.0.4) with the R packages stats (version 4.0.4), qvalue (version 2.20.0) and ggpubr (version 0.4.0).

For patient characterization, the median (with 25% and 75% inter quartile range) or percentage were calculated, for continuous or categorical variables, respectively. Wilcoxon-Test or Chi-Square Test of Independence were used to calculate the p-values.

The association between pairs of B cell populations and clinical variables was analysed using Kruskal-Wallis Test for categorical and Spearman's correlation for continuous clinical variables. To adjust for multiple testing the Benjamini-Hochberg procedure was used. For continuous variables linear regression lines were generated and for categorical variables the p-values (using Wilcoxon Test) between the categories were calculated. The same method was also used to examine association between pairs of clinical variables.

Multivariate linear regression was used to assess the relationship between B cell populations (percentage of CD19<sup>+</sup> B cells) and all clinical variables as used in the association analysis

while accounting for additional confounders such as age and oral corticosteroid (OCS) intake. To determine the significance of the clinical variable term, a model comparison approach was taken. A null model consisting of age and OCS (but without the clinical variable of interest) was compared to the full model consisting of the clinical variable, age and OCS using ANOVA. The resulting ANOVA derived p-values were subsequently corrected for multiple testing using Storey q-values [25].

To define SAD the upper limit of normal and percent predicted values of impulse oscillometry (IOS) parameters were determined according to the 95<sup>th</sup> centile of a German cohort of healthy adults [26].

To analyse the relationship between SAD and IgA<sup>+</sup> B cells and clinical variables, a multivariate linear model was built. Features for the model were chosen from age, gender, FeNO, sputum and blood eosinophils, sum of allergen-specific IgE, smoking (pack-years), body mass index (BMI) and OCS intake using a stepwise model selection by Akaike information criteria (AIC). Further information regarding the clinical variables are specified in the online data supplement.

### **Results**

### **Study population**

The study population included n=154 patients with asthma and n=28 healthy subjects from the ALLIANCE cohort. Mean age was comparable between patients and controls. 40% of patients suffered from severe asthma according to ERS/ATS guidelines [27]. More details are presented in table 1 and 2.

TABLE 1. Clinical characteristics of patients with asthma and healthy controls.

Clinical characteristics	Asthma patients (n=154)	Healthy controls (n=28)	p-value
Subjects		1	
Age [yrs]	53.1 (45.0, 64.9)	56.2 (36.1, 68.7)	0.97

### Patients with severe asthma have altered frequencies of B cell populations

We investigated peripheral B cells of patients and healthy volunteers by flow cytometry (supplementary figure S1).

Percentages of different B cell subpopulations were significantly associated with important clinical characteristics such as asthma severity, exacerbation frequency, blood neutrophils, sputum eosinophilia and lung function parameters (figure 1, table S3).

Patients with severe asthma showed a significant reduction of the immature B cell populations early transitional 1 (T1) and late transitional 2 (T2) B cells compared to patients with mild-moderate asthma and healthy subjects. Similarly, percentages of mature naïve B cells were diminished in patients with severe versus mild-moderate asthma, but comparable to the percentage of healthy volunteers (figure 2A, figure S2A, table S3). Conversely, proportions of unswitched CD27<sup>+</sup>IgM<sup>+</sup>, as well as class-switched CD27<sup>+</sup>IgG<sup>+</sup> and CD27<sup>+</sup>IgA<sup>+</sup> memory B cells were strongly increased in severe compared to mild-moderate asthma. In addition, CD27<sup>+</sup>IgM<sup>+</sup> and CD27<sup>+</sup>IgA<sup>+</sup> but not CD27<sup>+</sup>IgG<sup>+</sup> memory B cells were increased in severe asthma patients compared to healthy controls (figure 2A, figure S2A).

Patients with regular OCS intake showed similar findings as patients with severe asthma (figure 2B and S2B). An increased frequency of CD27<sup>+</sup>IgA<sup>+</sup> memory B cells occurred in uncontrolled disease according to GINA and was also associated with sputum eosinophilia, but not with blood eosinophilia or atopy (figure 2C, table S3).

# Impaired lung function is associated with increased $CD27^{+}IgA^{+}$ memory B cell frequency

Several lung function parameters indicative for airway obstruction were moderately associated with distinct B cell patterns. Increased frequencies of IgA<sup>+</sup> memory B cells were associated with central airway obstruction measured by FEV<sub>1</sub> and FEV<sub>1</sub>/FVC and small

airway obstruction measured by FEF<sub>25-75</sub> as well as IOS parameters reactance (AX) and R5-R20 (figure 2D, figure S2C, table S3).

# Association of $IgA^+$ memory B cells and airway obstruction is independent from OCS treatment

As presented above, regular treatment with OCS showed a significant association with all investigated B cell populations (figure 1, table S3). We chose a linear model to investigate if any of the associations seen in figure 1 remained significant independently of OCS intake and age (table 3).

**TABLE 3. Linear Model.**

memory B cell R5-R20		Regular OCS	1.152	0.406	0.005	0.032	
		(Intercept)	2.084	0.579			

**Table 3:** Linear model describing B cell subpopulations as a function of clinical characteristics with oral corticosteroids and age as confounders. Coefficient estimates, standard error, and p-value are given for each term in the model. P-values for the clinical variables were corrected for multiple tests (q-value) and all significant results are shown (q-value < 0.05). AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz–resistance at 20 Hz; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity.

The linear model confirmed the association of increased percentages of CD27<sup>+</sup>IgA<sup>+</sup> memory B cells with small airway dysfunction which was independent from OCS intake and age. The OCS-independent association was strongest between CD27<sup>+</sup>IgA<sup>+</sup> B cells and the IOS parameters AX (p-value  $3.3 \times 10^{-7}$ ) and R5-R20 (R5-R20 p-value  $7.2 \times 10^{-5}$ ) both indicating small airway obstruction (table 3). Comparing the association between R5-R20 and CD27<sup>+</sup>IgA<sup>+</sup> B cells in the linear model between patients with and without regular OCS intake showed no significant difference in the slope describing the association (p = 0. 148) however percentages of IgA<sup>+</sup> memory B cells were overall higher in patients with OCS (supplementary figure S3).

Additional associations were found for FEF<sub>25-75</sub>, FEV<sub>1</sub> and FEV<sub>1</sub>/FVC (table 3). Furthermore, percentages of CD27<sup>-</sup>IgA<sup>+</sup> B cell frequencies were also associated with AX and R5-R20 and additionally with frequency of severe exacerbations. All other associations seen between B cell populations were not independent from effects of oral steroid intake (table S4).

### IgA<sup>+</sup> memory B cells are increased in asthma patients with SAD

As shown by the linear model, lung function parameters indicative of peripheral airway obstruction showed a significant association with CD27<sup>+</sup> and CD27<sup>-</sup>IgA<sup>+</sup> memory B cells.

The strongest association was seen for both IOS parameters AX and R5-R20, which measure airway distensibility and small airway obstruction respectively. We were therefore interested to further investigate if these cells were also increased in patients with SAD. The IOS parameter R5-R20 has been shown to appropriately reflect resistance of the small airways [18], detect SAD in asthma patients [21] and corresponds well to important clinical outcomes of SAD in asthma patients [18, 21]. We consecutively used R5-R20 values above the upper limit of normal (95<sup>th</sup> centile) according to published reference equations [26] to define SAD in our cohort and to analyse its association with proportions of IgA<sup>+</sup> B cells in more detail.

SAD was present in 42% (63/152) of all asthma patients in our cohort. Of these, 43% (27/63) had mild-moderate asthma and 57% (36/63) had severe asthma. Further clinical characteristics of all asthma patients with and without SAD are specified in supplementary table 5.

Percentages of CD27<sup>+</sup>IgA<sup>+</sup> memory B cells were increased in patients with SAD (figure 3A), while CD27<sup>-</sup>IgA<sup>+</sup> memory B did not show any differences (figure S4A). Furthermore, we observed differences in CD27<sup>+</sup>IgA<sup>+</sup> memory B cells depending on disease severity (figure 3B). IgA<sup>+</sup> memory B cells were lowest in patients with mild-moderate asthma who did not have SAD and were significantly higher in mild-moderate asthma patients with SAD. Patients with severe asthma had overall increased percentages of IgA<sup>+</sup> B cells without a difference between patients with and without SAD.

SAD and peripheral airway obstruction can occur independently from central airway obstruction.  $IgA^+$  memory B cells were only increased in patients with both central airway obstruction measured by  $FEV_1/FVC$  and small airway obstruction measured by IOS (figure 3C). In patients with normal  $FEV_1/FVC$  and SAD, increase in percentage of  $IgA^+$  memory B cells did not reach statistical significance compared to patients without central or peripheral airway obstruction (p = 0.0662).

To investigate if IgA<sup>+</sup> memory B cells were associated with SAD in the context of other known risk factors such as age, gender, BMI, smoking and markers of T2 inflammation such as blood and sputum eosinophils, specific IgE and FeNO [20] we used a multivariate regression model. In patients with mild-moderate asthma, IgA<sup>+</sup> memory B cells were associated with SAD in addition to other known risk factors such as sputum eosinophils and gender (table 4). Adding severe asthma patients to the model did not show an association between SAD and IgA<sup>+</sup> memory B cells (table S6).

TABLE 4. Regression model for SAD defined by R5-R20 in mild-moderate asthma patients.

	Estimate	Standard Error	p-value	95% CI Lower Bound	95% CI Upper Bound

**Table 4:** Result of stepwise multivariate regression model (n=80). The dependent variable is SAD defined by the 95<sup>th</sup> centile of R5-R20. A stepwise-forward regression was used to find the best model using AIC. The table shows the variables with best model fit (CD27<sup>+</sup>IgA<sup>+</sup> memory B cells [%], sputum eosinophils [%], blood eosinophils [1000/μl], gender, sum of sIgE, sum of 36 allergen-specific Immunoglobulin E [kU/l]. Variables not selected by best model fit are not shown (regular OCS intake (yes/ no), FeNO [ppb], BMI [Kg/m²], age, and smoking [pack-years]).

### IgA+ memory B cells and clinical features of SAD

Patients with SAD present more often with uncontrolled asthma [28], frequent exacerbations [21] and impaired quality of life [18]. Percentages of CD27<sup>+</sup>IgA<sup>+</sup> and CD27<sup>-</sup>IgA<sup>+</sup> B cells correlated with the number of exacerbations similarly as sputum eosinophils (figure 4, table S7). Equally, CD27<sup>+</sup>IgA<sup>+</sup> were correlated with impaired asthma control and reduced quality of life as assessed by the Asthma Control Questionnaire (ACQ-7) and Asthma Quality of Life Questionnaire respectively (figure S5, table S8-9).

Since  $IgA^+$  B cells play an important role in mucosal immune defence, we analysed  $IgA^+$  memory B cells in SAD patients with frequent ( $\geq 2x$  per year) respiratory tract infections (RTIs). In the ALLIANCE cohort, patients with and without SAD did not differ regarding the occurrence of frequent RTIs (17/63 patients with SAD reported frequent RTIs, 17/89 without SAD and with frequent RTIs, p=0.341). Equally, in patients with SAD, frequencies of  $IgA^+$  memory B cells did not differ depending on presence or absence of frequent RTIs (figure S6).

### **Discussion**

In this study we demonstrated significant alterations of immature and mature B cell populations in asthma. Importantly, we described for the first time an unappreciated connection of IgA<sup>+</sup> memory B cells with SAD. IgA<sup>+</sup> memory B cells were associated with peripheral airway obstruction measured by R5-R20 irrespective of disease severity and correlated with an increased number of severe exacerbations and worse asthma control.

OCS intake is known to be a major confounder of systemic immune responses, an effect that was evident for most B cell populations examined in our study. Importantly, the link between increased systemic IgA<sup>+</sup> memory B cell frequencies and lung function parameters indicative for peripheral airway obstruction such as R5-R20, AX and FEF<sub>25-75</sub> [18, 21] was independent of the influence of OCS intake and age. R5-R20 has been shown to reflect increased narrowing of the small airways [18, 21] and important clinical outcomes [18, 29]. We

therefore used published reference equations for R5-R20 to define SAD and demonstrated an increase of IgA<sup>+</sup> B cells in patients with SAD. This link was particularly evident in patients with mild-moderate asthma indicating a role for IgA<sup>+</sup> B cells in SAD irrespective of disease severity. This is important as SAD is not only found in severe asthma patients but also in mild-moderate disease [20, 21].

Little is known so far about inflammation or remodelling processes in the peripheral airways in asthma mostly due to their difficult accessibility. Histology data originates mostly from patients with fatal asthma attacks [30], limiting its translation to asthma patients in general. There is some evidence for a role of T2 inflammation in SAD from *in vitro* experiments [31] and histology of transbronchial biopsies revealed eosinophilic inflammation, particularly in the parenchyma of patients with nocturnal asthma symptoms [32] – symptoms that are connected to SAD [28]. Clinical markers of T2 inflammation for example blood and sputum eosinophils have also been linked to the presence of SAD [20] and T2 targeting biologicals have been shown to ameliorated peripheral airway resistance measured by R5-R20 [33]. However, overall knowledge about inflammation connected to SAD is still very limited particularly also regarding the impact of B cells on SAD in asthma patients.

While our study is the first to link IgA<sup>+</sup> memory B cells with SAD in asthma, our finding is supported by several studies linking IgA<sup>+</sup> B cells to small airway inflammation in chronic obstructive pulmonary disease (COPD). Histology studies of lungs from patients with COPD show increased IgA<sup>+</sup> B cell frequencies in lymphoid follicles, particularly in the distal lung parenchyma and close to small airways, which correlate with disease severity [16]. Furthermore, in COPD there is a strong link between localized mucosal deficiency of secretory IgA (sIgA) and increased inflammation and airway remodelling most likely driven by impaired local pathogen defense [17, 34]. Additionally, reduced capacity for transcytosis of IgA over the epithelial barrier has been shown in both small airways of COPD patients [34]

and airway epithelial cells in asthma [35] and sIgA in bronchoalveolar lavage fluid inversely correlates with asthma symptoms [36].

It remains however unsolved if increased presence of IgA<sup>+</sup> B cells in the lung periphery of COPD patients with small airway disease reflect an exacerbated response against pathogens, potentially due to intraluminal sIgA deficiency or if they could drive inflammation and remodelling for example by producing antibodies against self-antigens [16].

Here, we showed for the first time that SAD in asthma patients is associated with increased frequencies of circulatory IgA<sup>+</sup> memory B cells. This is in concordance with previous observations showing that systemic and pulmonary memory B cells pools are connected, as memory B cells in the lung depend on both local induction [37] as well as replenishment from extra-pulmonary organs [38, 39]. Furthermore, we carefully investigated and excluded other reasons for increased blood IgA<sup>+</sup> memory B cells in the context of asthma as frequent respiratory tract infections, smoking [40] and atopy [41].

Based on our analysis and previously published histological evidence [30], IgA<sup>+</sup> memory B cells could serve as a biomarker for inflammation of the small airways – a compartment of the lung which is difficult to reach for diagnostic evaluation especially in asthma patients in whom lung histology is usually not available. However, due to the observational character of the ALLIANCE cohort, we cannot answer the question whether increased IgA<sup>+</sup> memory B cells are a cause or co-phenomenon of SAD. Future studies need to confirm this link and assess its use as a biomarker for SAD development and progression.

In addition to our results regarding IgA<sup>+</sup> memory B cells, we demonstrate substantial changes of other B cell populations in asthma. Naïve mature B cells, as well as T1 and T2 B cells were reduced in patients with severe asthma compared to mild-moderate asthmatics, while IgG<sup>+</sup> and IgM<sup>+</sup> memory B cells were increased in severe asthma. However, these findings did not remain significant after correction for regular OCS intake, a treatment which affected 58% of the severe asthma patients in our cohort demonstrating the importance of considering steroid

effects in the analysis. Further differentiation between asthma-specific or steroid-effects or a combination of both was therefore not possible for these B cell populations – a problem which has been described by other authors as well, particularly in regards to early B cell differentiation [42] [43]. Equally, the association seen between several B cell populations and blood neutrophils in our data set did not remain significant after correction for OCS, most likely also due to effects of OCS on neutrophil frequencies [44]. Noteworthy, we were able to uncover a significant and OCS independent association between IgA<sup>+</sup> memory B cells and SAD. Still, we cannot completely exclude an additional effect of OCS on IgA<sup>+</sup> memory B cell frequencies in patients with severe asthma. This could also explain why the multivariate model which compared IgA<sup>+</sup> memory B cells to other known risk factors for SAD, only revealed a significant association when focusing on patients with mild-moderate asthma who are not exposed to OCS or high inhaled doses of corticosteroids.

A particular strength of our study is the stringent statistical design. Treatment effects are an inevitable problem in asthma research since most patients are already under treatment at the time of inclusion into an observational study. Therefore, appropriate statistical measures need to be applied to control for OCS effects which confirmed in our study a new and until now undescribed role of IgA<sup>+</sup> memory B cells in asthma patients with SAD.

A weakness of our study is that we did not investigate B cells in lung tissue or in the airways. Lung histology as used in COPD studies is rarely available for patients with asthma. Future studies should explore and correlate lung and blood IgA<sup>+</sup> memory B cells, using bronchoalveolar fluid or sputum and ideally lung tissue in combination with additional support from experimental murine models [7]. Additionally, more data is needed regarding the predictive use of IgA<sup>+</sup> memory B cells for SAD development.

In conclusion, we showed that B cell populations are altered in asthma compared to controls, differ between mild-moderate and severe asthma and described disease-specific changes in the B cell repertoire which are independent from systemic corticosteroid effects.

Our results reveal a new and until now undescribed association of IgA<sup>+</sup> memory B cells in asthma patients with SAD, an important clinical feature of asthma with significant impact on symptom burden and quality of life. Most importantly, our data highlights for the first time a role for IgA<sup>+</sup> B cells in asthma and particularly in SAD even in milder disease stages. Future studies are needed to elucidate the specific effects of IgA<sup>+</sup> B cells on the development of SAD and to investigate the use of IgA<sup>+</sup> memory B cells as a biomarker for early diagnosis of SAD in asthma and prevention of lung function decline.

### Acknowledgement

We thank the patients who participate in the ALLIANCE cohort for their invaluable contribution to our research. We thank Susann Prange, Corinna Derwort, Jana Bergmann, Anika Dreier, Beate Junk, Michaela Bartsch, and Christin Albrecht for their excellent technical support and Julia Kontsendorn for critical data documentation and quality control.

**Online Data Supplement** 

### **Materials and methods**

### Study design, methods, and definition of clinical variables

Study visits were only scheduled if a patient was without respiratory tract infections and asthma exacerbations for at least 4 weeks prior to the study visit. During each visit comprehensive questionnaire data was collected regarding asthma and rhinitis symptoms, medication, asthma control, exacerbation and quality of life. Lung function tests including spirometry with reversibility testing, body plethysmography and impulse oscillometry (IOS) were performed using a Masterscreen Body and IOS (Vyaire Medical, Germany) according to established guidelines [1-4]. Lung function parameters were expressed as z-scores [3]. Specific IgE against 36 aero- and food allergens were analysed centrally by Immunoblot (EuroImmun AG, Lübeck, Germany), differential blood counts were assessed in local laboratories. Induced sputum was obtained using an established protocol [5].

Definitions of clinical variables used in the analysis are specified in supplementary Table S1.

TABLE S1. Definition of clinical variables

Variable	Definition		
Asthma severity	Defined as mild-moderate or severe asthma according to ERS / ATS guideline 2014 [6]		
Asthma control	Assessed by Asthma Control Test (ACT) [7], Asthma Control Questionnaire (ACQ-7) [8] or defined as controlled, partly controlled or uncontrolled according to GINA guideline [9]		
Asthma related quality of life	Assessed by the Asthma Quality of Life Questionnaire (AQLQ) [10]		
Severe exacerbation	Three days of oral corticosteroids (OCS) treatment or increase of regular OCS dose over a period of at least three days		
Atopy	Sensitization against at least one allergen with a specific IgE $\geq 0.7$ kU/l from a panel of 36 aero- and food allergens		

Sum of specific IgE [kU/l]	Sum of 36 allergen-specific IgE measurements /36		
Sputum inflammation [11]	Paucigranulocytic (eosinophils < 2%, neutrophils < 40%)		
	Eosinophilic (eosinophils $\geq$ 2%, neutrophils $<$ 40%)		
	Neutrophilic (eosinophils < 2%, neutrophils ≥ 40%)		
	Mixed (eosinophils $\geq 2\%$ , neutrophils $\geq 40\%$ )		
Inhaled corticosteroids (ICS)	Expressed as fluticasone proprionate equivalent		
Smoking status	Never or former smokers <10PY		
	Current or former smokers ≥10PY		
Positive bronchodilator response	Increase of $FEV_1 \ge 12\%$ or 200ml after inhalation of		
(BDR)	400μg salbutmatol		
Adult onset	Asthma onset at adult age (≥ 18 years)		
Body mass index (BMI)	weight (Kg) / [height (m)] <sup>2</sup>		
Small airway dysfunction (SAD)	Defined as R5-R20 (IOS) above the upper limit of		
	normal (95th centile) using age, sex, weight and height		
	adapted reference equations of a German cohort of		
	healthy adults [12]		

GINA, Global Initiative for Asthma; PY, pack-years; FEV<sub>1</sub>, forced expiratory volume in 1 second; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s]; OCS, oral corticosteroids; IgE, Immunoglobulin E.

### **B** cell characterization

PBMCs were isolated from heparinized blood by Biocoll (Biochrom, Berlin, Germany) density-gradient centrifugation. Until further use cells were stored in freezing medium (90% FBS, 10% DMSO; Biochrom; Sigma-Aldrich, Steinheim, Germany, respectively) in liquid nitrogen. For phenotypic analyses of B cell subpopulations, isolated PBMCs were blocked with normal rat and mouse serum, followed by incubation with suitable antibodies. Dead cells were excluded by Live/Dead staining according to the manufacturer's instructions (supplementary table S2). B cell subsets were measured on a FACSCanto II flow cytometer (BD, Heidelberg, Germany) and analyzed by FlowJo software (TreeStar, Ashland, OR, USA). Gating strategies are shown in supplementary figure S1. B cell populations were always presented as percentage of total live CD19<sup>+</sup> B cells.

TABLE S2. Anti-human antibodies used for flow cytometric analyses of B cell subsets in peripheral blood

Marker / Dye	Fluorophore	Clone	Company
LIVE/DEAD Fixable	omovon		Invitrogen, Carlsbad, CA, USA
Dead Cell Stain	amcyan		mivitrogen, Carisbau, CA, USA
CD19	PE Cy7	HIB19	BioLegend, San Diego, CA, USA
CD19	PerCP Cy5.5	HIB19	BioLegend, San Diego, CA, USA
CD24	FITC	ML5	BD, Franklin Lakes, NJ, USA
CD27	Pacific Blue	M-T271	BioLegend, San Diego, CA, USA
CD27	APC	O323	eBioscience, San Diego, CA, USA
CD38	PerCP Cy5.5	HIT2	BioLegend, San Diego, CA, USA
IgM	Pacific Blue	MHM-88	BioLegend, San Diego, CA, USA
IgG	PE Cy7	G18-145	BD, Franklin Lakes, NJ, USA
IgA	PE	IS11-8E10	MACS Miltenyi Biotec, Bergisch
			Gladbach, Germany

### Statistical analysis

Clinical variables and B cell populations included in the association analysis are specified in figure 1 and supplementary table S1. Categorical variables comprised gender, smoking status (never or former smoker <10 pack-years/ current or former smoker ≥10 pack-years), GINA control status (controlled/ partly controlled/ uncontrolled), positive bronchodilator response defined as increase of FEV₁ ≥ 12% or 200ml after inhalation of salbutmatol (yes/no), asthma severity according to ERS/ATS Guideline 2014 (mild-moderate/ severe), regular oral corticosteroid intake (yes/no), sputum inflammation type (neutrophilic/ eosinophilic/ mixed/ paucigranulocytic). Continuous variables comprised age, BMI [Kg/m²], age at first asthma diagnosis, FEV₁ [z-score], FEV₁/FVC [z-score], FEF₂₅-7₅ [z-score], reactance area [kPa/l/s], R5-R20 [kPa/l/s]; blood neutrophils [1000/µ1], blood eosinophils [1000/µ1], specific IgE (sum of 36 specific IgE against allergens/36), and severe exacerbations. The dataset version used for the analysis was 20180731\_V2-1.

B cell subsets were always displayed as percentage of total B cells (CD19<sup>+</sup> B cells) and included naïve B cells (CD19<sup>+</sup>CD27<sup>-</sup>CD24<sup>low</sup>CD38<sup>low</sup>), early transitional 1 B cells (T1 B cells, CD19<sup>+</sup>CD27<sup>-</sup>CD24<sup>high</sup>CD38<sup>high</sup>) and late transitional 2 B cells (T2 B cells, CD19<sup>+</sup>CD27<sup>-</sup>CD24<sup>high</sup>CD38<sup>med</sup>), unswitched CD27<sup>+</sup>IgM<sup>+</sup> memory B cells, class-switched CD27<sup>-</sup>IgG<sup>+</sup> and CD27<sup>+</sup>IgG<sup>+</sup> as well as CD27<sup>-</sup>IgA<sup>+</sup> and CD27<sup>+</sup>IgA<sup>+</sup> memory B cells.

The same variables were included into the linear regression model with age and regular systemic corticosteroid intake as co-variables.

Some variables have missing data: Sputum cell counts are missing in n=5 healthy controls and n=21 asthma patients; FEF<sub>25-75</sub> is missing in n=30 asthma patients, number of severe exacerbations in n=9, asthma quality of life questionnaire in n=8 asthma patients.

The multivariate regression model included SAD defined by the 95<sup>th</sup> centile of R5-R20 and percentage of CD27<sup>+</sup>IgA<sup>+</sup> memory B cells, regular OCS intake (yes/ no), blood eosinophils [1000/µl], sputum eosinophils [%], FeNO [ppb], BMI [Kg/m²], gender, age, sum of 36 allergen-specific IgE and smoking [pack-years].

# **Supplementary Figure Legends**

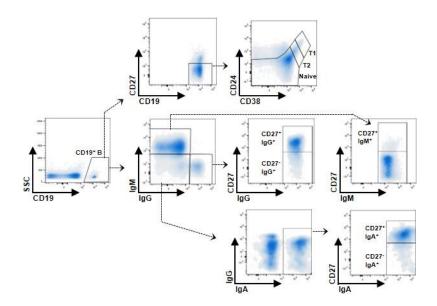

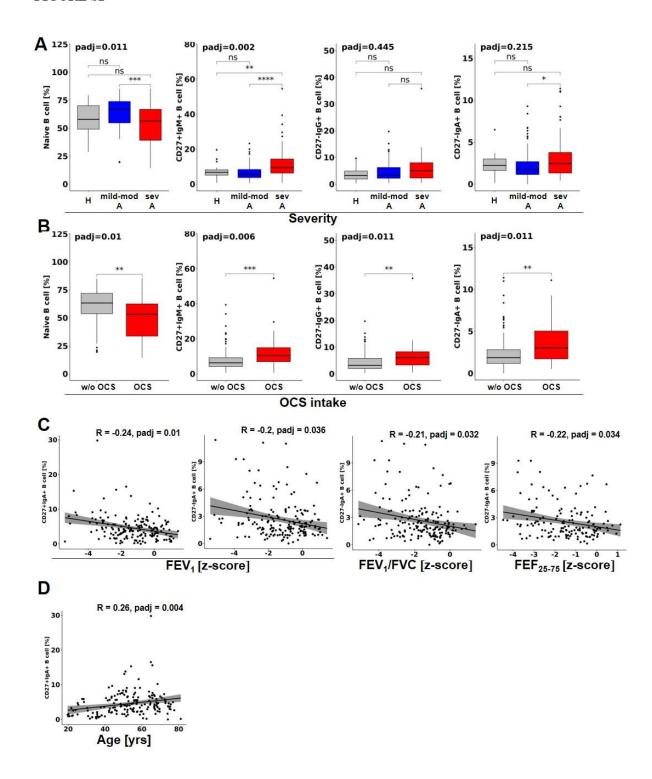

FIGURE S1. Flow cytometry gating strategy of peripheral blood B cell subpopulations.

After dead cell exclusion, total B cells were gated as CD19<sup>+</sup>. CD27<sup>-</sup> B cells were further subdivided into Transitional 1 (T1) B cells, Transitional 2 (T2) B cells and Naïve B cells via CD24 and CD38. CD19<sup>+</sup> memory B cell subpopulations were gated as IgM<sup>+</sup>, IgG<sup>+</sup>, and IgA<sup>+</sup> cells and subdivided into CD27<sup>+</sup>IgM<sup>+</sup> cells as well as CD27<sup>+</sup> and CD27<sup>-</sup> IgG<sup>+</sup> and IgA<sup>+</sup> cells, respectively.

#### FIGURE S2

**FIGURE S2. Associations between B cell subsets and clinical parameters.** Association with asthma severity (A), and OCS intake (B), FEV<sub>1</sub> and FEV<sub>1</sub>/FVC, FEF<sub>25-75</sub> (C) and age (D)

are shown. Overall adjusted p-values after multiple test corrections and p-values from categorical group comparisons are shown as well as R and adjusted p-values from Spearman correlations. H, healthy; mild-mod A, mild-moderate asthma; sev A, severe asthma; OCS, oral corticosteroids; w/o OCS, without OCS; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz–resistance at 20 Hz; ns, not significant; \* p < .05, \*\* p < .01; \*\*\* p < .001; \*\*\*\* p < .001; \*\*\*\* p < .0001.

## FIGURE S3.

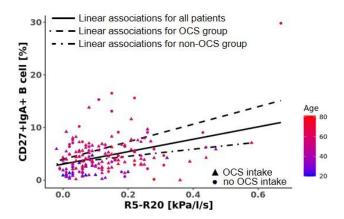

FIGURE S3. OCS independent association between R5-R20 and CD27<sup>+</sup>IgA<sup>+</sup> B cells. CD27<sup>+</sup>IgA<sup>+</sup> B cell frequencies were associated with R5-R20 regardless of OCS treatment (adjusted p-value < 0.002). The linear associations for all patients is given as a solid line and the dotted lines represent the linear associations for OCS (---) and non-OCS (---) groups. The difference in slope between the two groups is not significant (p = 0.148). Age is illustrated by color;  $\triangle$  OCS intake,  $\bullet$  no OCS intake; OCS, oral corticosteroids.

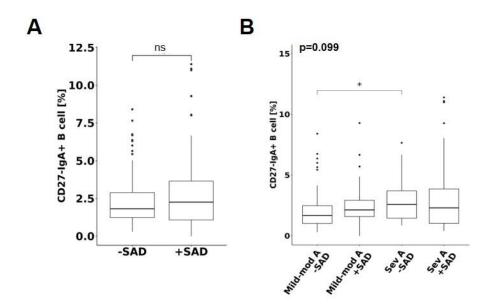

FIGURE S4. CD27<sup>-</sup>IgA<sup>+</sup> memory B cells and small airway dysfunction. CD27<sup>-</sup>IgA<sup>+</sup> B cells in patients with and without SAD (A), in patients with mild-moderate or severe asthma (B). SAD, small airway dysfunction; sev A, severe asthma; mild-mod A, mild-moderate asthma. ns, not significant; \* p < .05.

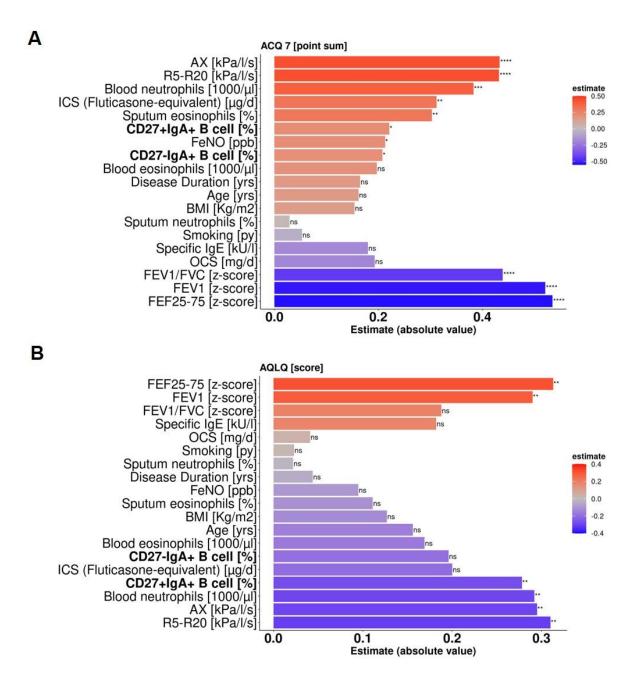

FIGURE S5. Correlations of Asthma Control Questionnaire 7 and Asthma Quality of Life Questionnaire with clinical and B cell parameters. Dark red defines the highest positive correlation between the parameters and dark blue shows the lowest negative correlation between the variables. Adjusted p-values are depicted at the right bar side. no, number; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC,

FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled Nitric oxide; ppb, parts per billion; BMI, Body Mass Index; yrs, years; ICS, inhaled corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s]; ns, not significant; \* p < .05, \*\* p < .01; \*\*\*\* p < .001; \*\*\*\* p < .0001.

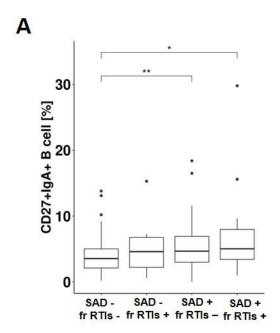

Figure S6: IgA+ memory B cells of asthmatic patients with or without SAD in combination with frequent respiratory infections.

SAD, small airways dysfunction; fr, frequent; RTIs, respiratory tract infections; \* p < .05, \*\* p < .01;

### **Supplementary Table Legends**

TABLE S3. Pairwise comparisons between B cell populations and clinical variables in asthma patients and healthy controls. Overall comparisons between categorical clinical parameters and B cell variables (A). Comparisons between all categorical groups of the clinical parameters and B cell variables (B). Comparisons between B cell populations and continuous clinical variables in asthma patients and healthy controls (C). B cell subsets are presented as percentage of CD19<sup>+</sup> B cells. Coefficient estimates, p-values and adjusted p-values after multiple test corrections are shown. GINA, Global Initiative for Asthma; BDR, bronchodilator response; OCS, oral corticosteroids; BMI, Body Mass Index; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s]; IgE, Immunoglobulin E; T1 B cell, Transitional 1 B cells; T2 B cell, Transitional 2 B cells.

**TABLE S4. Linear Model.** Linear models describing B cell subpopulations as a function of clinical characteristics with oral corticosteroids and age as confounders. Coefficient estimates, standard error, and p-value are given for each term in the model. P-values for the clinical variables were corrected for multiple tests (q-value). BMI, Body Mass Index; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz–resistance at 20 Hz; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; FEV1, forced expiratory volume in 1 second; FVC, forced vital capacity; BDR, bronchodilator response; PY, pack-years.

TABLE S5. Clinical characteristics of patients with versus without SAD. Data is presented as median (25%, 75% IQR), and number (%). Yrs, years, BMI, Body Mass Index; PY, pack-years; GINA, Global Initiative for Asthma; ACQ, Asthma Control Questionnaire; AQLQ, Asthma Quality Of Life Questionnaire; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s]; AX, reactance area [kPa/l/s]; ULN, upper limit of normal; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; LTRA, leukotriene antagonist; LABA, long-acting β<sub>2</sub> agonist; LAMA, long-acting muscarinic antagonist.

TABLE S6. Regression model for SAD defined by R5-R20. Result of stepwise multivariate regression model including asthma patients with severe and mild-moderate asthma (n=121). The dependent variable is SAD defined by the 95<sup>th</sup> centile of R5-R20. A stepwise-forward regression was calculated to find the best model using AIC. The table shows the variables with best model fit (sputum eosinophils [%], gender, and age). Variables not selected by best model fit are not shown (regular OCS intake (yes/ no), blood eosinophils [1000/μl], sum of sIgE, sum of 36 allergen-specific Immunoglobulin E [kU/l], FeNO [ppb], BMI [Kg/m²], smoking [pack-years], and CD27<sup>+</sup>IgA<sup>+</sup> memory B cells [%]).

**TABLE S7.** Correlations between exacerbation frequency and clinical parameters and **IgA**<sup>+</sup> **memory B cells.** Estimates and adjusted p-values after multiple test corrections are shown. No, number; BMI, Body Mass Index; yrs, years; PY, pack-years; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; ICS, inhaled

corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s].

**TABLE S8.** Correlations between Asthma Control Questionnaire (ACQ-7) and clinical parameters and IgA+ memory B cells. Estimates and adjusted p-values after multiple test corrections are shown. FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; BMI, Body Mass Index; yrs, years; PY, pack-years; ICS, inhaled corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s].

TABLE S9. Correlations between Asthma Quality Of Life Questionnaire (AQLQ) and clinical parameters and IgA<sup>+</sup> memory B cells. Estimates and adjusted p-values after multiple test corrections are shown. FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; BMI, Body Mass Index; yrs, years; PY, pack-years; ICS, inhaled corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s].

TABLE S3. Pairwise comparisons between B cell populations and clinical variables in asthma patients and healthy controls. Overall comparisons between categorical clinical parameters and B cell variables (A). Comparisons between all categorical groups of the clinical parameters and B cell variables (B). Comparisons between B cell populations and continuous clinical variables in asthma patients and healthy controls (C). B cell subsets are presented as percentage of CD19<sup>+</sup> B cells. Coefficient estimates, p-values and adjusted p-values after multiple test corrections are shown. GINA, Global Initiative for Asthma; BDR, bronchodilator response; OCS, oral corticosteroids; BMI, Body Mass Index; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s]; IgE, Immunoglobulin E; T1 B cell, Transitional 1 B cells; T2 B cell, Transitional 2 B cells.

Table S4. Linear Model

**TABLE S4. Linear Model.** Linear models describing B cell subpopulations as a function of clinical characteristics with oral corticosteroids and age as confounders. Coefficient estimates, standard error, and p-value are given for each term in the model. P-values for the clinical variables were corrected for multiple tests (q-value). BMI, Body Mass Index; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz–resistance at 20 Hz; FEF<sub>25-75</sub>, forced expiratory flow

at 25% - 75% of FVC; FEV1, forced expiratory volume in 1 second; FVC, forced vital capacity; BDR, bronchodilator response; PY, pack-years.

 $\label{thm:continuous} \textbf{Table S5. Clinical characteristics of patients with versus without SAD } \\$ 

Clinical variable	Patients with SAD (n=63)	Patients without SAD (n= 89)	p-value

TABLE S5. Clinical characteristics of patients with versus without SAD. Data is presented as median (25%, 75% IQR), and number (%). Yrs, years, n, number of patients; BMI, Body Mass Index; PY, pack-years; GINA, Global Initiative for Asthma; ACQ, Asthma Control Questionnaire; AQLQ, Asthma Quality Of Life Questionnaire; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s]; AX, reactance area [kPa/l/s]; ULN, upper limit of normal; FEV1, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV1/FVC, FEV1 as % of FVC; FEF25-75, forced expiratory flow at 25% - 75% of FVC; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; LTRA, leukotriene antagonist; LABA, long-acting β2 agonist; LAMA, long-acting muscarinic antagonist.

TABLE S6. Regression model for SAD defined by R5-R20

	Estimate	Standard Error	p-value	95% CI Lower Bound	95% CI Upper Bound
Age [yrs]	0.031	0.016	0.046	1.002	1.066
Gender (female)	-0.674	0.393	0.086	0.233	1.094
Sputum eosinophils [%]	0.016	0.011	0.134	0.995	1.039

TABLE S6. Regression model for SAD defined by R5-R20. Result of stepwise multivariate regression model including asthma patients with severe and mild-moderate asthma (n=121). The dependent variable is SAD defined by the 95<sup>th</sup> centile of R5-R20. A stepwise-forward regression was calculated to find the best model using AIC. The table shows the variables with best model fit (sputum eosinophils [%], gender, and age). Variables not selected by best model fit are not shown (regular OCS intake (yes/no), blood eosinophils [1000/μl], sum of sIgE, sum of 36 allergen-specific Immunoglobulin E [kU/l], FeNO [ppb], BMI [Kg/m²], smoking [pack-years], and CD27<sup>+</sup>IgA<sup>+</sup> memory B cells [%]).

TABLE S7. Correlations between exacerbation frequency and clinical parameters and  $IgA^+$  memory B cells

Exacerbations [no]	OCS [mg/d]	-0.065	0.814
Exacerbations [no]	Sputum neutrophils [%]	-0.097	0.423
Exacerbations [no]	FEV <sub>1</sub> /FVC [z-score]	-0.241	0.023
Exacerbations [no]	Specific IgE [kU/l]	-0.242	0.021
Exacerbations [no]	FEV <sub>1</sub> [z-score]	-0.27	0.01
Exacerbations [no]	FEF <sub>25-75</sub> [z-score]	-0.32	0.008

**TABLE S7.** Correlations between exacerbation frequency and clinical parameters and IgA+ memory B cells. Estimates and adjusted p-values after multiple test corrections are shown. No, number; BMI, Body Mass Index; yrs, years; PY, pack-years; FEV1, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV1/FVC, FEV1 as % of FVC; FEF25-75, forced expiratory flow at 25% - 75% of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; ICS, inhaled corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s].

TABLE S8. Correlations between Asthma Control Questionnaire (ACQ-7) and clinical parameters and IgA+ memory B cells

Clinical variable	Variable	estimate	adjusted p-value
ACQ 7 [point sum]	AX [kPa/l/s]	0.433	< 0.001
ACQ 7 [point sum]	R5-R20 [kPa/l/s]	0.432	< 0.001
ACQ 7 [point sum]	Blood neutrophils [1000/µl]	0.383	< 0.001
ACQ 7 [point sum]	ICS (Fluticasone-equivalent) [µg/d]	0.312	0.004
ACQ 7 [point sum]	Sputum eosinophils [%]	0.303	0.008
ACQ 7 [point sum]	CD27 <sup>+</sup> IgA <sup>+</sup> B cell [%]	0.221	0.037
ACQ 7 [point sum]	FeNO [ppb]	0.213	0.046
ACQ 7 [point sum]	CD27 <sup>-</sup> IgA <sup>+</sup> B cell [%]	0.208	0.049
ACQ 7 [point sum]	Blood eosinophils [1000/µl]	0.197	0.065
ACQ 7 [point sum]	Disease Duration [yrs]	0.165	0.12
ACQ 7 [point sum]	Age [yrs]	0.162	0.123
ACQ 7 [point sum]	BMI [Kg/m <sup>2</sup> ]	0.154	0.144
ACQ 7 [point sum]	Sputum neutrophils [%]	0.029	0.831
ACQ 7 [point sum]	Smoking [py]	-0.053	0.658
ACQ 7 [point sum]	Specific IgE [kU/l]	-0.18	0.088
ACQ 7 [point sum]	OCS [mg/d]	-0.193	0.405
ACQ 7 [point sum]	FEV <sub>1</sub> /FVC [z-score]	-0.439	< 0.001
ACQ 7 [point sum]	FEV <sub>1</sub> [z-score]	-0.521	< 0.001
ACQ 7 [point sum]	FEF <sub>25-75</sub> [z-score]	-0.535	< 0.001

**TABLE S8.** Correlations between Asthma Control Questionnaire (ACQ-7) and clinical parameters and IgA+ memory B cells. Estimates and adjusted p-values after multiple test corrections are shown. FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; BMI, Body Mass Index; yrs, years; PY, pack-years; ICS, inhaled corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s].

TABLE S9. Correlations between Asthma Quality Of Life Questionnaire (AQLQ) and clinical parameters and IgA+ memory B cells

Clinical variable	Variable	estimate	adjusted p-value
AQLQ [score]	FEF <sub>25-75</sub> [z-score]	0.313	0.009
AQLQ [score]	FEV <sub>1</sub> [z-score]	0.290	0.008
AQLQ [score]	FEV <sub>1</sub> /FVC [z-score]	0.188	0.085
AQLQ [score]	Specific IgE [kU/l]	0.182	0.09
AQLQ [score]	OCS [mg/d]	0.041	0.847
AQLQ [score]	Smoking [py]	0.023	0.847
AQLQ [score]	Sputum neutrophils [%]	-0.022	0.847
AQLQ [score]	Disease Duration [yrs]	-0.044	0.735
AQLQ [score]	FeNO [ppb]	-0.095	0.418
AQLQ [score]	Sputum eosinophils [%]	-0.111	0.378
AQLQ [score]	BMI [Kg/m <sup>2</sup> ]	-0.127	0.257
AQLQ [score]	Age [yrs]	-0.156	0.144
AQLQ [score]	Blood eosinophils [1000/µ1]	-0.169	0.12
AQLQ [score]	CD27 <sup>-</sup> IgA <sup>+</sup> B cell [%]	-0.196	0.069
AQLQ [score]	ICS (Fluticasone-equivalent) [µg/d]	-0.200	0.065
AQLQ [score]	CD27 <sup>+</sup> IgA <sup>+</sup> B cell [%]	-0.278	0.009
AQLQ [score]	Blood neutrophils [1000/µl]	-0.292	0.008
AQLQ [score]	AX [kPa/l/s]	-0.295	0.008
AQLQ [score]	R5-R20 [kPa/l/s]	-0.310	0.005

**TABLE S9.** Correlations between Asthma Quality Of Life Questionnaire (AQLQ) and clinical parameters and IgA+ memory B cells. Estimates and adjusted p-values after multiple test corrections are shown. FEF<sub>25-75</sub>, forced expiratory flow at 25% - 75% of FVC; FEV<sub>1</sub>, forced expiratory volume in 1 second; FVC, forced vital capacity; FEV<sub>1</sub>/FVC, FEV<sub>1</sub> as % of FVC; IgE, Immunoglobulin E; OCS, oral corticosteroids; FeNO, fractional exhaled nitric oxide; ppb, parts per billion; BMI, Body Mass Index; yrs, years; PY, pack-years; ICS, inhaled corticosteroids; AX, reactance area [kPa/l/s]; R5–R20, resistance at 5 Hz – resistance at 20 Hz [kPa/l/s].
