

Dynamic Data Ingestion

Places of origin of students at European universities (1200-1800), colour-coded by university. The data are available in four separate research databases on pre-modern university history. As part of a SNSF SPARK project, these databases were merged into a metadatabase using the 'Dynamic Data Ingestion' module developed for this purpose. This module is integrated into a virtual research environment (nodegoat) and allows to ingest (import) data of individual databases into a metadatabase by using a graphical interface. Since nodegoat has data analysis tools (map visualisations, network analyses and time series) the ingested data can be evaluated accordingly. The visualisation shows all the students' places of origin in the metadatabase.
