The screenshot shows the homepage of the COST-G website. At the top, there is a blue header with the COST-G logo and the text "Combination Service for Time-variable Gravity Fields". Below the header is a navigation menu with links for Home, Introduction, Consortium, Service, Products, The COST-G Plotter, Documents, and Contact. The main content area features a large heading "Welcome to COST-G" followed by a paragraph describing the service. To the right, there is a "Latest News" section with two entries: one dated April 14th 2022 about a new publication on gravity field models, and another dated December 17th 2021 about precise orbit determination of Low Earth Orbiters.

Welcome to COST-G

The International Combination Service for Time-variable Gravity Fields (COST-G) is a product center of the [International Gravity Field Service \(IGFS\)](#) and is dedicated to the combination of monthly global gravity field models. COST-G stems from the activities of the former H2020 project [European Gravity Service for Improved Emergency Management \(EGSIEM\)](#) and is further developed within the follow-up project [Global Gravity-Based Groundwater Product \(G3P\)](#), which is funded from the European Union's Horizon 2020 Research and Innovation Programme under Grant Agreement no. 870353 (funding period 2020-2022).

Please use the top menu to visit the various parts of our website!

Best regards,
Your COST-G Team.

Latest News

April 14th 2022

We have a new publication online:
[COST-G gravity field models for precise orbit determination of Low Earth Orbiting Satellites.](#)

December 17th 2021

Precise orbit determination (POD) of Low Earth Orbiters (LEOs) depends on the precise knowledge of the Earth's gravity field

For background information on COST-G and links to products take a look at: <https://cost-g.org/>

Peter H, Meyer U, Lasser M, Jäggi A (2022): COST-G gravity field models for precise orbit determination of Low Earth Orbiting Satellites. *Advances in Space Research* (69), **12**, 4155-4168.

Fitted Signal Model (FSM) for operational LEO-POD

RMS of differences (over land, 300 km Gauss): FSM - monthly gravity fields

Operational precise orbit determination (POD) of low Earth orbiters (LEO) relies on a Earth gravity model including time-variable gravity (TVG).

The EIGEN-GRGS-RL04 model (green) has been the standard for LEO-POD of altimeter satellites, but the extrapolation to the GRACE-FO period reveals large prediction errors.

For comparison, a model fitted to COST-G GRACE-FO gravity fields is shown (red).

Polar mass trend (no filter)

Surprisingly, the reason for the prediction error in the EIGEN-GRGS-RL04 model (green) seems not to be in regions with strong mass trends.

Hydrological cycle in large river basins (300 km Gauss)

The time-series of monthly GRACE gravity field solutions was fitted in yearly batches for the EIGEN-GRGS-RL04 model.

While the fit in the GRACE period is very good, the extrapolation of the last of these batches leads to large errors in river basins with strong non-seasonal variations.

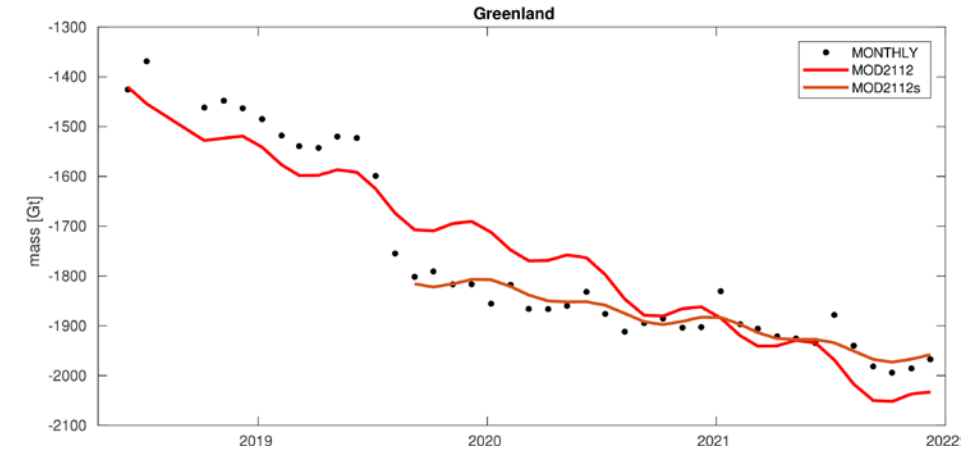

Application to Sentinel orbit POD

Sentinel - 3B (altitude 811 km) orbit determination

The carrier phase RMS of dynamic Sentinel-3B satellite orbits (orbit altitude 811 km) based on monthly GRACE-FO gravity fields (green) or different fitted signal models reveals the benefit of up-to-date models. All models were truncated at max. degree/order 90.

Impact of fit period on LEO-POD (Sentinel-3B, altitude 811 km)

Carrier phase residuals of Sentinel-3B orbits (811 km orbit altitude) confirm the sensitivity on the data period that entered the model.

Independent orbit validation

SLR-validation Sentinel-3B

Data: Year 2020, Sentinel-3B, SLR validation, 12 stations (cm)

Gravity field model	Mean (cm)	RMS (cm)	Standard deviation (cm)
DEIGEN120	0.29	1.01	0.97
DEIGEN90	0.29	1.01	0.97
D90MONTHLY	0.28	0.91	0.87
D90MODEL2012	0.28	0.92	0.88
RDEIGEN120	0.31	0.91	0.85
RDEIGEN90	0.31	0.91	0.85
RD90MONTHLY	0.31	0.88	0.82

The limited max. degree does not negatively affect LEO POD (S3B)

LEO POD profits from monthly gravity fields

The fitted signal models perform close to the monthly gravity fields

Reduced dynamic LEO POD is less sensitive to model deficiencies.

GOCE orbit fit

3D-RMS values [cm] of the orbit fit residuals (mean values from the involved arcs)
 Parametrization: 6 orbital elements, accelerometer biases 1/arc (3 directions)

	March			April			June			December		
Model/Month	2019	2020	2021	2019	2020	2021	2019	2020	2021	2019	2020	2021
COST-G FSM	5,53	5,77	6,30	5,37	5,72	6,39	5,39	5,86	6,63	5,48	6,05	7,78
COST-G monthly	6,42	7,10	7,27	6,36	7,06	7,84	6,40	7,36	7,62	6,94	7,51	7,57
COST-G (G3P)	5,92	6,76	6,79	5,99	6,55	7,30	5,85	6,68	6,86	6,38	6,77	7,21
ITSG-Grace operational n96	5,94	6,95	7,11	5,93	6,69	7,08	5,68	6,33	6,77	6,17	6,95	7,36

- COST-G fitted signal models (FSM), augmented by high-degree coefficients from a static field (GOCO06S), show significant improvement w.r.t. the monthly models of ITSG and COST-G in almost all cases!

Outlook

Unified Analysis Workshop
October 21-23, 2022, Thessaloniki, Greece

Extension of COST-G FSM for REPRO purposes

Extension of the COST-G FSM to cover the whole GRACE/GRACE-FO period:

- Fit of GRACE monthly models in yearly batches
- Continuity conditions between individual batches
- Fit of GRACE-FO monthly models in one batch to allow for prediction.

Consistency with monthly models

The monthly GRACE gravity fields were screened prior to the fit of the extended COST-G FSM => outliers indicate monthly solutions of inferior quality.

Where to get the COST-G fitted signal models?

Unified Analysis Workshop
