Technical University of Graz, Austria (5) Deutsches Zentrum für Luft- und Raumfahrt (6) Groupe de Recherche de Geodesie Spatiale, Toulouse, France (7) Institute of Geodesy, University of Hannover, Germany (8) Géode & Cie, Toulouse, France

Objectives

The Grant Preparation with the European Commission in the frame of the Horizon 2020 program has been successfully completed last year and EGSIEM has officially started on January 1, 2015.

The three main objectives of EGSIEM are:

- delivering the **best gravity products** for applications in Earth and environmental science research,
- reducing the latency and increasing the temporal resolution of the gravity and therefore mass redistribution products,
- developing gravity-based indicators for extreme hydrological events and demonstrating their value for flood & drought forecasting and monitoring services.

Project Partners

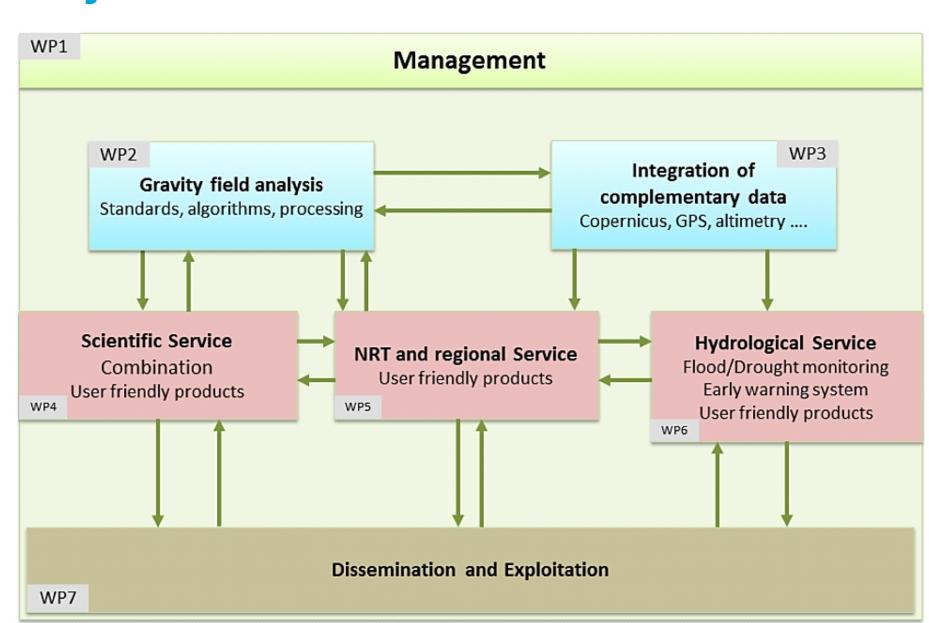

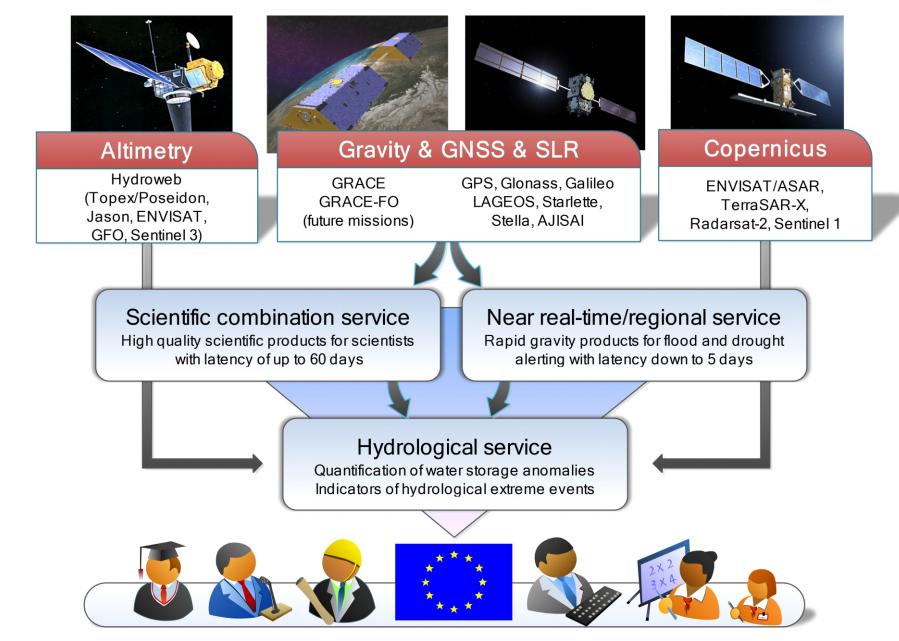

Project Structure

The used input data sources and the anticipated services that shall be established are reflected in the EGSIEM WP structure.

Upcoming Services

Services will be tailored to the needs of governments, scientists, decision makers, stakeholders and engineers. Special visualisation tools will be used to inform, update, and attract also the large public.

Scientific Service

In the frame of the project different groups will generate gravity field solutions based on independent processing strategies: **GFZ**

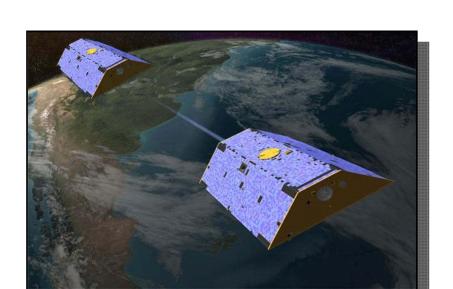

direct approach **CNES**

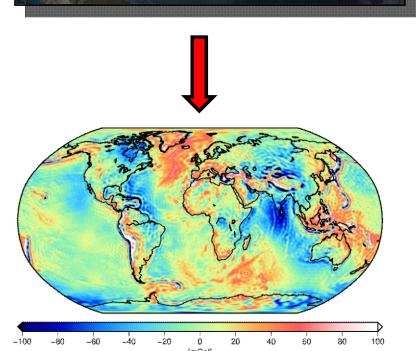

direct approach **AIUB**

celestial machanics approach **ITSG**

short-arc approach **University of Luxembourg** acceleration approach

(may be more in future)

Adopting rigorous and independent processing approaches, each analysis center will deliver consistent gravity field solutions. For the first time, a meaningful combination of gravity field solutions will be possible.

This task will be coordinated by AIUB, it includes

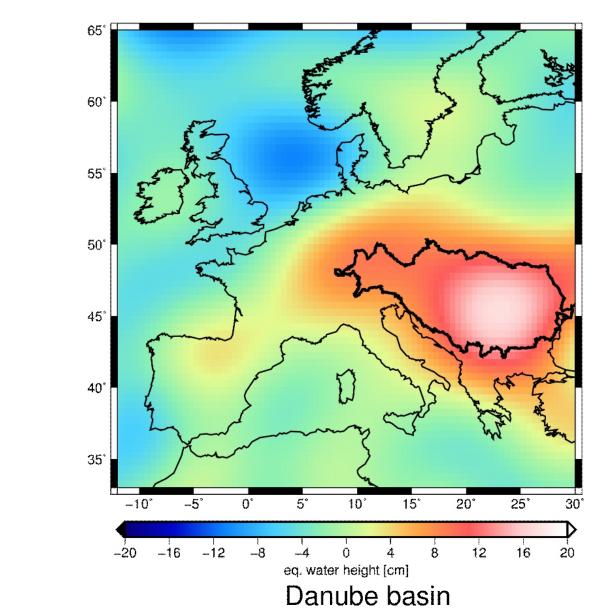

- comparison of the analysis center solutions, identification of gross errors
- pair-wise comparison of gravity solutions to approximate empirical weights for the individual analysis centers
- combination of all analysis centers solutions to generate combined solutions using the following two schemes: calculate weighted averages based on the empirical
- weights determine the combined solution based on a combination of normal equations (NEQ) generated by the individual analysis centers
- provide suitable products for hydrological and geophysical applications from the combined and individual analyse center products

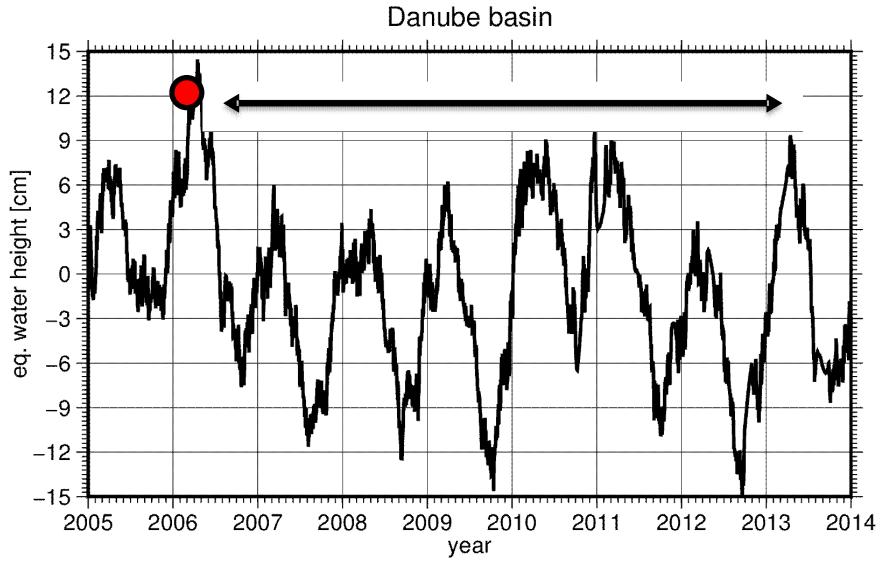

Near Real Time and Regional Service

Daily updated solution (Near real-time with max. 5 days delay) ITSG:

Kalman filtered solutions **GFZ**:

Alternative representations (e.g., radial basis functions)

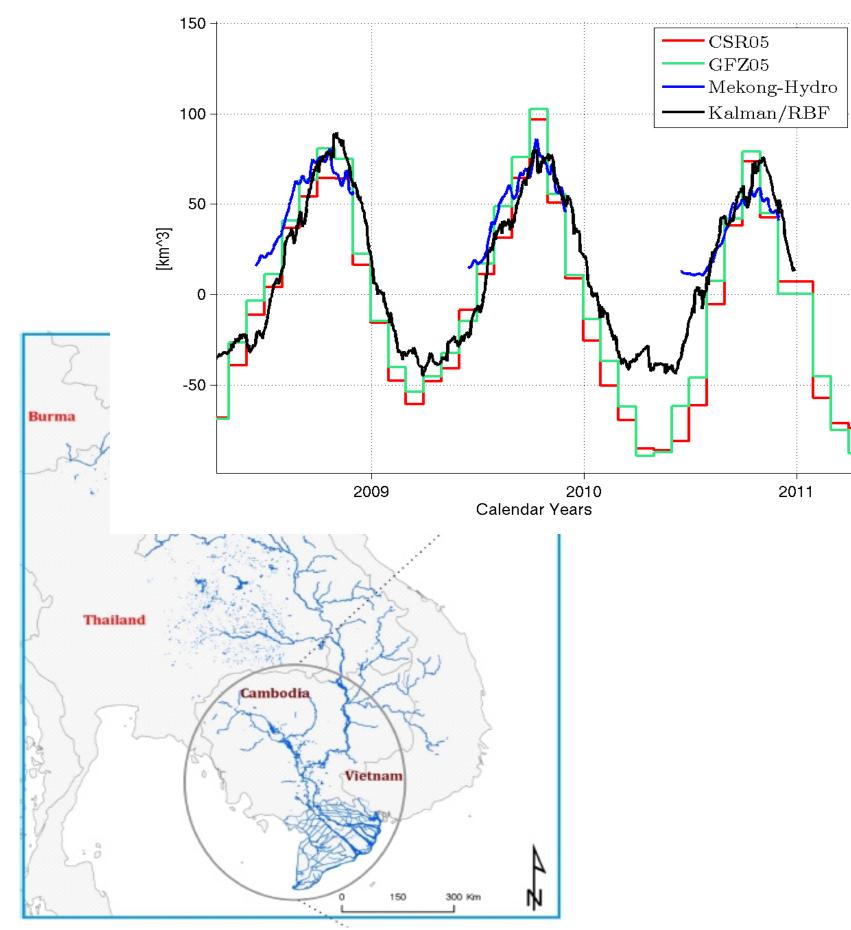

EGSIEM Visualization Tool: Extension of The GRACE Plotter,

Hydrological Service

Gravity-based flood and drought indicators as descriptors of the integral wetness status of river basins → early warning for hydrological extreme events.

Integration into automatic flood emergency management services. An operational test run of half a year is foreseen in the frame of DLR's Center for Satellite Based Crisis Information.

Testing the added value of gravity-based indicators at different lead times (several months to near real time)

- Future integration into the services of the International

Association of Geodesy (IAG), e.g., under the umbrella of the

International Gravity Field Service (IGFS), and into the

- EGSIEM will have an open data policy and is open for

- Collaborations/associating projects with other partners are very

In collaboration with and supported by

welcome. Service Level Agreements can be signed anytime

- via assimilation into flood forecasting models

- The EGSIEM project started on January 1st, 2015.

- EGSIEM will run for three years (2015-2017).

Copernicus emergency service is envisaged.

Status of the Project

Dissemination and Exploitation

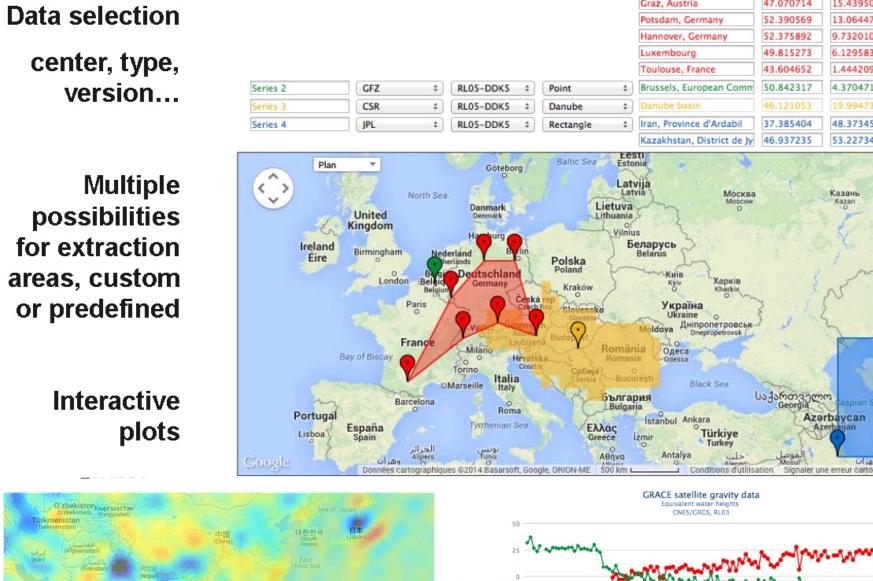

A central component of the EGSIEM dissemination activities will be the EGSIEM plotter, which allows easy data access and visualization (examples on the right hand side).

EGSIEM will have an open data policy with respect to all data generated within the project. Accessibility to all levels will be guaranteed via the project website: http://www.egsiem.eu

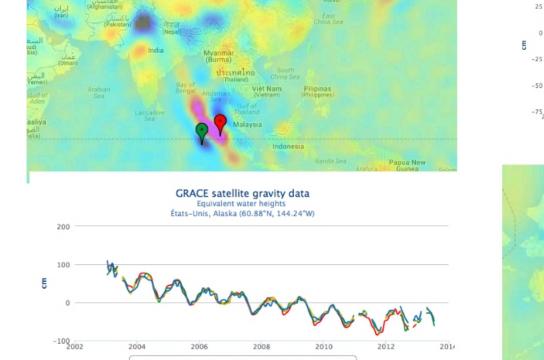

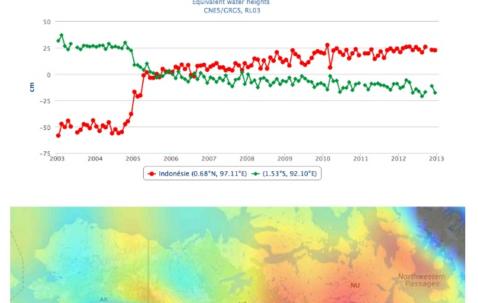

You are kindly invited to subscribe to the quarterly EGSIEM

aperture radar (SAR) sensors (e.g. TerraSAR-X, Radarsat-2, ALOS-2 which all operate in different wavelengths, i.e. X,C and L-band) are optimally suited for providing reliable information on floods,

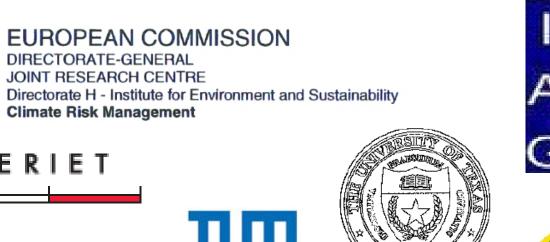

developped by Géode & Cie for CNES.

Acknowledgement

This project has received funding from the European Union's Horizon 2020 research and innovation program under the grant agreement No. 637010.
