**Russia:** Prof. Dr. Zarethkan Saraliev, Prof. Dr. Vladimir Blonin, Prof. Dr. Alexander Iudin

**South Africa:** Prof. Dr. Karl Peltzer

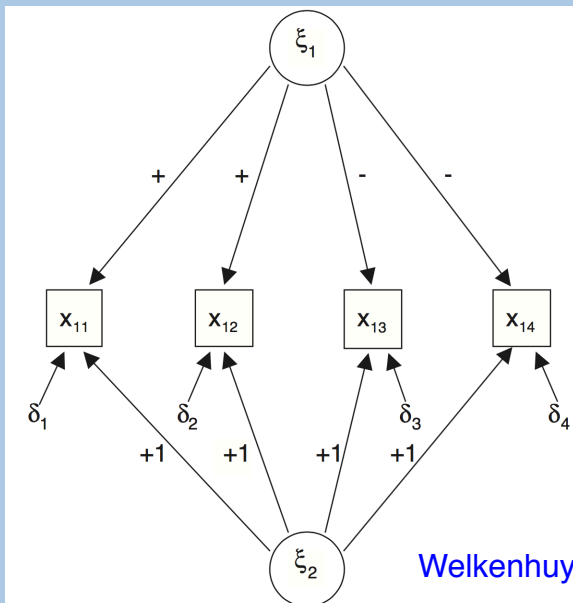

**Turkey:** Dr. Bilge Ataca, Prof. Dr. Cigdem Kagitcibasi

**United States:** Prof. Dr. Wolfgang Friedlmeier, Prof. Dr. Mihaela Friedlmeier

Many thanks to **Sebastian Strahm** for his help in data analysis.

# Measurement Equivalence and Response Bias Across Cultures

- > “Strong” (scalar) equivalence as precondition for cross-cultural mean comparisons (Byrne, 2008; Cheung & Rensvold, 2000)
- > But: MACS CFA cannot control for uniform response bias (Little, 2000)
- > Single response style factor (He, Bartram, Inceoglu, & van de Vijver, 2014)
- > Further recent developments:

Welkenhuyesen-Gybels, Billiet, & Cambre (2003)

# (Within-subject) Standardization / Ipsatization

- > Ipsatization recommended to control for culture-specific response bias in mean comparisons (Fischer, 2004; Fischer & Milfont, 2010)
- > But which kind of ipsatization? “Single Construct” (e.g. Schwartz values) or “All items of a questionnaire”?
- > Caution – “fixed pie” – possibly controlling for content in addition to bias!
- > Psychological assessment literature: ipsatized measures appropriate with large number of constructs (> 10) and low intercorrelations among constructs (< .30) (Baron, 1996; Bartram, 1996)
- > Alternative: random selection of items measuring different underlying constructs and are uncorrelated (Weijters, Schillewaert, & Geuens, 2008)

“Representative Indicators Response Style Means and Covariance Structure” (RIRSMACS)

Current Study: Using RIRS for 1) ipsatization and 2) response style indicators (acquiescence and extremity responding, ANCOVAs) and comparing results

# VOC-Project: Mothers and Adolescents from 17 Cultural Groups

# Family Values

- > Core aspect of collectivism, substantial cross-cultural variation documented (Triandis, 1990; Georgas, Berry, van de Vijver, Kagitcibasi, & Poortinga, 2006)
- > Five-item short scale based on Georgas (1991)

1	2	3	4	5
Strongly disagree	Slightly disagree	Neither agree nor disagree	Slightly agree	Strongly agree

1. One should maintain good relationships with one's relatives.
2. Children have an obligation to care for their parents when their parents are old.
3. A family's problems should be solved within the family.
4. We should honor and protect our family's reputation.
5. Children should obey their parents.

Traditional family values including two main aspects: 1) hierarchy and 2) relationships within the family.

Internal consistencies mixed, but structural equivalence ok (using target rotation approach).

# Response Style Indicators 1

- > Ipsatization across all Likert-scale items of the questionnaire (including target construct)
  - Subtract grand mean (+ divide by grand SD)
  - Some items/constructs had to be discarded since...
    - not included all cultural groups
    - too many missings (e.g. relationship with grandparents)
  - Mothers: 137 items from 13 constructs
  - Adolescents: 171 items from 17 constructs

## Response Style Indicators 2

- > Ipsatization across random subset of 15 items (excluding items from target construct)
  - Subtract grand mean based on 15 items (+ divide by grand SD)
  - Partly the same items for mothers and adolescents
  
- > Acquiescence and Extremity indicators based on the same subset of 15 randomly selected items
  - Acquiescence: double count 5 + count 4
  - Extremity: count 1 + 5
  
- > Check if randomly selected items are (mostly) uncorrelated (see next slide)

# Correlations Among the 15 Randomly Selected Items

Mothers: Mean of corrected item-total correlations: .11 (vs. .25)

## Discussion

- > Very similar results for RIRS ipsatization and RIRS response style indicators (ANCOVA adjusted means)
- > Ipsatizations based on total questionnaire obviously confounds content and style
  - too few and too highly correlated constructs
  - valid only with clear theoretical basis (e.g., Schwartz) and/or low overall correlations of constructs?
- > Rank order of original means **not** strongly affected by controlling for culture-specific response styles (RIRS approach)
- > Cross-cultural differences attenuated (from  $R^2 \approx .22$  to  $R^2 \approx .12$ )
- > RIRS ipsatization useful approach for controlling response bias?
