

Trialkylation of cyclic thioiminium ions

M. Mojzesova¹, P. Mateo¹, P. Renaud^{1*}¹University of Bern

Thioiminium ions are excellent bis-electrophiles for the preparation of symmetrical *gem*-dialkylated cyclic amines. [1] More recently, we have developed the addition of organocopper reagents to thioiminium ions for the functionalization of the α -position of nitrogen atom, a method to prepare non-symmetrical *gem*-dialkylated cyclic amines. [2]

Here, we report an extension of this work, where a cyclic thioiminium ion is converted into trialkylated cyclic amines in a one-pot process via successive treatment with nucleophile (R^1M), an electrophile (R^2X) and a second nucleophile (R^3M). The scope and limitation of this reaction as well as its mechanism will be discussed.
