Figure S3. Male nuptial colour segregation in F2 half-sib family PN1-33. The parental types were almost fully recovered in several F2 males. Brood number is shown above the males. Male1 was a cross between a *P. sp.* “pundamilia-like” female and a *P. sp.* “nyererei-like” male whereas male 2 was a cross in the opposite direction. Both males were mated with F1 females from a cross in the opposite direction than themselves (i.e. sisters of the other male). Spawning decisions of half-sib and full-sib sisters are shown in figure S2.
